Address:

General Comment

As an American who grew up in the 90s, I've grown up surrounded by technology, and have grown up alongside the growth of computers and all the incredible things they can do. To me, it is a wondrous thing to see all that technology has become capable of doing. However, for all the good that technology is able to do, it cannot be underestimated the ill that it is, perhaps, even more capable of. And it is on that latter capacity that I remark upon right now.

Generative AI is a fun toy to play around with. I can understand why so many see it as a compelling are to play around with. However, it cannot be ignored that most generative AI models are built upon regurgitation. They absorb incredible amounts of data from other sources and then smush it together. They are, inherently, unable to create new ideas, and everything of value they produce is taken from human beings whose work they have absorbed. This is not a model that we, as Americans, should want to see succeed. And certainly it is not something that we should *incentivize* by giving these mammoth companies free reign to violate the rights of other people to the proceeds of their works by using these often misunderstood AI models as an excuse. Exemptions for Copyright in this realm is an absolute mistake. Whether the infringement is intentional by individuals within those companies, or obfuscated through layers of AI &^%, they should be subject to all of the laws we already have on the books.
