General Comment

The proliferation of generative AI technology has raises critical ethical and legal concerns—particularly regarding the unauthorized use of copyrighted images and data. Copyright law exists to protect the intellectual property rights of creators, ensuring their work is respected, acknowledged, and fairly compensated. When generative AI systems are trained on or use such material without proper consent or licensing, it undermines the value of creative labor and compromises the principles of fair use. It also makes creators afraid to create anymore.

Moreover, generative AI has the potential to be weaponized in disinformation campaigns. For instance, manipulated content—like fabricated videos of public figures in compromising or false scenarios—can spread rapidly, eroding trust and fueling misinformation. A notable example is the digitally altered video of Elon Musk kissing Donald Trump, which highlights how such technology can distort reality and mislead audiences.
