General Comment

Generative AI is, at its core, a machine dedicated to devaluing skilled labor. The large language models that are all the rage in the tech sphere are trained on work without the consent or even knowledge of those who created it, and used to create subpar amalgamations of that work based on calculated probability rather than real knowledge or understanding. The United States does not need to achieve dominance in the AI sector because the technology itself is all flash and no substance on a dead-end road. What we need instead are strong regulations that protect the people who are losing their jobs because corporations would rather divest themselves of workers with actual skills in favor of a cheap alternative that looks like it can do the same, though time and time again its outputs only make more work for those left behind.

Private sector AI innovation needs to be strictly regulated, for the sake of the people who are losing their jobs, incomes, and livelihoods to hype. Generative AI is ultimately non-viable, a massive drain on both power and water resources that delivers low-quality results, and the United States needs strong regulations to manage the ethical concerns regarding how models are trained and used.
