General Comment

AI dominance wont happen if you allow the fuel to leak freely from the engine.

Whether you need dominance is another question entirely driven by greed, short sighted viewpoint, lackadaisical understanding of the subject matter and general ignorance of economics.

To resolve the former you cannot eliminate content creators and then bemoan the lack of source material for training. You also must understand that regardless of promises to the contrary from corporations with vested interest in over inflating claims so secure investment (from both the gullible and the greedy who do recognize a pump and dump when they see one), scaling as an approach to AI is plateauing. It is a copy machine, a lossy compression of what it is trained on. It does not extrapolate. It does not exceed. You wont get "AGI", "ASI" or anything else that grants tactical or technological lead from scaling ML models alone, it cannot be more human than a human and thats all your leading ML technologies have been trained to do. China has already shown with Deepseek that the investment in muscle is poor compared to investment in brains. Throttling that for a skeleton crew in an AI corporation rather than leveraging your full open source and world wide resource is kneecapping yourself.

AI as a business model has failed to generate revenue. Has failed to deliver on its promises and will continue to do so. Do not be the out of touch old men scammed out of your country by slick smooth talking snake oil salesmen. Make no mistake, this is what you are dealing with.

AI as imagined by Silicon Valley magnates cannot turn real profit. It's raiding the till. Even if it ever were to reach the low end of the potentials promised the disruption alone would cripple the economy with next to zero profits, simply accreting all resource to a tiny group. Their solution? Offload the problems onto the government that wont be able to afford it.

Within government you will find champions for AI's dystopian aspects. Surveillance and disinformation, autocratic gains. Not for existential threat but internal. Tantamount to declaring war on your own population and building big brother. Your job is to represent not rule, and learn from the cautionary tales especially presented by those who lived the hell that man can create - we have not progressed. Those who see the potential in these nefarious uses of technology cannot be smart enough to realize that they would only be the patsy to these corporations, opening a door that results not just in the elimination of all that annoying bureaucracy bellow them but in the elimination of their own role. That what they see as protection of their government is in fact a sedition, abdication to multinational businesses with no allegiance. They should instead be concerned with protection of their country.

Worse financially while the killer applications of disinformation, disruption and surveillance might seem solid business model, this makes a tiny market. Once "solved" there's no incentive to pursue other avenues. The system you build will disincentivize such disruption. You will both eliminate 80% of the GDP & jobs and stultify your entire intellectual economy for promises that cannot manifest with this tech stack. In effect, you will ironically destroy the US AI lead if there is any such thing.

If you pursue the lie of AI making primary profit you will doom your country to being a long way from the top.

All is not lost though! There is only one solution that protects the country. Protects the economy. Ensures an America First agenda and you're not going to like it because all of your pies in the sky will come crashing down around AI. Sure that will happen anyway, but it feels more painful when they're not realized :

Eliminate the primary profit motive, incentivize the secondary.

Secondary benefits from AI are all within productivity and technological progress, thus economic. Unfortunately mostly it's eliminated by primary profits because innovation requires opportunity, and positive innovation that actually generates GDP and progress requires lawful opportunity. The other path eliminates innovation and lawful opportunity.

If however you remove that primary profit motive, taxing all profit derived from AI and its content at 100% (which might seem incredibly hare-brained and scary until you understand the economics of what's going on and how this is the single path towards economic and technological dominance), you will open up the use of AI as augmentation to people and in turn industry. To the academic and open source worlds which have far more minds with far greater potential than merely those who cannot even build profitable product. Open to optimization.

To save the US and its government you will find you must constitutionally ban government use of AI.

The economic benefit isn't from making AI in any case, it's from serving it. That's where you create advantage.
