General Comment

I am a writer, software developer, and technologist. Any AI Action Plan must not undercut Copyright's incentive to create. Companies like OpenAI have deals with certain copyright holders to use their material for training. However, these deals do not cover all of the material that is used for training. All copyright holders deserve to be paid when their intellectual property is used for training. Any AI company that receives revenue from the output of an AI model that is unable or unwilling to pay all copyright holders of the data used for training should be required to pay royalties to those copyright holders. As an analogy, Canada has a "blank media levy" on media such as blank CD-R's (blank recordable compact discs). (https://en.wikipedia.org/wiki/Private_copying_levy) It is also reported that AI companies (in this case, Meta) remove copyright notices from training data. ("Judge says Meta must defend claim it stripped copyright info from Llama's training fodder" https://www.theregister.com/2025/03/11/meta_dmca_copyright_removal_case/) This shows that AI companies are knowingly removing information that could be used to connect AI model output with the authors of the copyrighted source material used for training. AI companies should be required to retain this information so that copyright holders can be properly compensated. Future AI models should be built with the capability to correctly and fully attribute the copyrighted materials used to generate each output.
