Re: Accenture Response to Request for Information on the Development of an AI Action Plan

Dear Mr. D'Souza,

AI has the potential to transform industries and the workforce, strengthen economic and national security, and improve the ways government serves its citizens. As the Trump administration has indicated, the United States has the opportunity—and responsibility—to take steps now that will cement its global leadership on AI innovation and ensure it realizes this full potential.

For that reason, Accenture and Accenture Federal Services (AFS) are pleased to submit our recommendations in response to the U.S. government's request for information on an AI Action Plan.

We are at the center of AI adoption, partnering with America's technology leaders to bring tech, data and AI to companies across all sectors of the U.S. economy—from manufacturing and life sciences to financial services and consumer goods—and government at all levels. We therefore understand AI's immense promise as well as the challenges that must be addressed.

Critically, the U.S. must rapidly transform the business of government—and broad deployment of AI is an essential component. We offer this and several other recommended areas of focus:

1. **Transforming the Business of Government.** By focusing on AI adoption in areas with the greatest potential to transform government, streamlining procurement processes, and investing in workforce training, the federal government can harness AI to improve citizen services, reduce costs, and enhance national security.
2. **Supporting American-Made AI for Broad-Based Economic Prosperity.** America's leadership in AI depends on a strong, secure foundation across the AI tech stack. That means investing in domestic AI technology production, ensuring access to computing power, expanding support for small tech innovators, and bringing AI jobs to all regions of the country. The federal government should continue funding Tech Hubs across the country and reform permitting processes to meet AI's growing energy demands.
3. **Ensuring the U.S. Has a World-Class, AI-Ready Workforce.** America's leadership in AI also depends on having a strong, agile and skilled workforce now and into the future. The federal government should help ensure American workers are equipped with the skills they need because the success of AI will be determined by the people who build and use it. That means

supporting efforts to continuously reskill and upskill the workforce as technology evolves and expanding the available pool of AI-fluent workers, including through alternative pathways like apprenticeships. It also means exploring ways to encourage the broader introduction of AI education in K-12 classrooms and attracting the best talent from around the world to the U.S.

4. **Creating an Environment to Maximize AI Innovation and Adoption.** A fragmented patchwork of state AI laws threatens to slow AI innovation by increasing complexity and costs. To encourage AI development and deployment, we support federal action that preempts these laws. A national data privacy law is also critical—one that preempts the varying state laws and enables innovation while protecting consumers.
5. **Maintaining U.S. Leadership in Global AI Standards.** AI is a global technology, and America must shape its future on the world stage while securing access to global markets for American-made AI products and services. The U.S. should engage with international bodies to establish clear, interoperable AI standards that align with our values, promote fair competition and enhance accuracy and performance.

AI is a force multiplier for economic growth, security, and public service. The right policies today will ensure the U.S. remains at the forefront of AI innovation.

Andrew J.P. Levy

Accenture

Denise Zheng
Chief AI Officer, Data & AI Lead
Accenture Federal Services

RECOMMENDATIONS

1. TRANSFORM THE BUSINESS OF GOVERNMENT WITH AI

The rapidly evolving AI landscape presents tremendous opportunity for federal agencies to transform operations and enhance service delivery. The time is now for government to lean into accelerating the adoption of AI and automation. By embracing innovation while thoughtfully developing robust infrastructure, expertise, and governance frameworks, agencies can position themselves at the forefront of technological advancement, particularly in promising areas like Agentic AI.

Strategically Implement AI Solutions in Areas with the Greatest Potential for Transformation.

Agencies should embrace a culture of experimentation and innovation, focusing on high-impact applications across the enterprise that address mission-critical challenges. Agencies can achieve breakthrough improvements in effectiveness and efficiency with AI. This approach positions government to deliver tangible benefits to citizens while simultaneously building the organizational capabilities needed to lead in the AI-powered future.

As this journey commences, agencies should move decisively to implement AI solutions in proven high-impact areas where immediate value can be demonstrated, including:

- **Enhanced Fraud Prevention:** Implement multi-layered AI detection systems that combine anomaly detection, behavioral analysis, and predictive modeling to identify sophisticated fraud patterns across programs. These systems should continuously learn from new schemes while minimizing false positives that impact legitimate beneficiaries.
- **Intelligent Citizen Service Platforms:** Deploy conversational AI systems across contact centers and help desks that can handle complex inquiries, authenticate users securely, and seamlessly escalate to human agents when necessary. These systems should integrate with existing case management systems.
- **Document Intelligence & Knowledge Management:** Deploy solutions that not only extract information from unstructured documents but also understand relationships between entities, identify policy implications, and automatically route documents based on content analysis. These tools should make institutional knowledge discoverable and actionable across organizational silos.
- **Productivity Enhancement Tools:** Integrate AI writing assistants, data analysis tools, and process automation capabilities that augment workforce capabilities while preserving human judgment on critical decisions. These tools should be designed with specific needs of the federal workforce in mind.

Advancing Agentic AI in Government. Agentic AI—systems that can autonomously plan and execute complex tasks across multiple systems—represents a significant opportunity. Areas like benefits processing, resource allocation, or regulatory reviews are ideal starting points. These agents should combine large language models with traditional rule-based systems to ensure compliance with federal regulations. These agentic systems should have robust monitoring, explainability features, and human intervention capabilities, including real-time operation dashboards, audit trails of agent decisions, and configurable approval workflows for sensitive actions.

Reform Federal Procurement and Security Practices to Streamline Acquisition. To lead in AI, the U.S. government must reform IT procurement and security to enable agencies to access cutting edge technologies more quickly and cheaply and incentivize commercial AI leaders to offer their services to the government. To enable faster and more agile AI acquisition by federal agencies under the AI Action Plan, the U.S. government should:

- **Transform Federal Security and Authorization Practices:** The administration should reinvent the Authority to Operate (ATO) process and FedRAMP based on commercial best practices to reduce costs and accelerate the time to get new technologies into government, including:
 - Increasing the number of assessors under FedRAMP and investing in technologies to automate security assessment intake and review, as well as documentation and reporting;
 - Clarifying what data and systems truly require the highest levels of authorization and which can be safely assigned to low or moderate tiers to reduce costly and time-consuming approvals for moderate risk systems;
 - Simplifying the process for evaluating changes to existing services with ATO authorization and provide exemptions from re-review for minor updates;
 - Continuing to expand multi-agency and program ATO processes to facilitate interagency approvals and reduce redundancy across agencies; and
 - Continuing to explore light-touch approaches like self-attestation by vendors to accelerate AI adoption and enable smaller players to compete in the federal market.
- **Develop AI Marketplaces:** Partner with hyperscalers to develop AI marketplaces on existing platforms that already have ATO authorization to enable rapid adoption of existing tools and applications across the wider government and create an avenue for smaller vendors with cutting-edge technologies to access the federal market.
- **Mandate Reciprocity Between Security Regimes:** Different security regimes used across federal agencies should be aligned and reciprocity mandated (e.g. FedRAMP High vs. IL4) to streamline the approval process, eliminate the need for repetitive evaluations, and allow agencies to leverage existing security assessments.
- **Adopt Procurement and Innovation Best Practices from the Private Sector.** Adopt commercial best practices in federal contracting, enabling consumption-based pricing, autoscaling, and rapid scaling of AI applications.
- **Enable Experimentation:** Establish centralized departmental AI sandboxes as innovation hubs, controlled environments in which they can experiment with a variety of pre-approved AI models and applications.

Build Institutional Knowledge and Competence. Ensuring that best practices are shared between and within agencies will be critical to avoiding cost overruns, technical implementation difficulties and post-deployment issues. To reduce risk, agencies should, to the greatest extent possible, create formal information sharing networks and build on the knowledge and experiences of other agencies.

- **Establish Formal Information Sharing Mechanisms:** Incentivize federal agencies to share knowledge, resources, and best practices related to AI safety through working-level interagency

groups. The purpose of these forums would be to capture and disseminate lessons from early AI implementations, including technical, governance, procurement, and management insights.

- **Create Cross-Agency Communities of Practice:** Communities of practice should focus on specific AI application areas to prevent duplicative efforts and continuously improve implementation where different agencies, or different offices within the same agency, are leveraging AI for the same purpose.
- **Develop Standardized Evaluation Frameworks for AI Solutions:** Evaluation frameworks should assess both performance and alignment with federal requirements.
- **Maintain Internal AI Inventories that are More Robust and Internally Discoverable:** Executive Order 13960, which has been repealed by President Trump, required agencies to share with the public non-classified and non-sensitive AI use case inventories. Transparency is critical to promote trust by the public in federal agencies' use of AI, but to publicize the inventories, the details of the use cases were scant. Sharing more information about AI inventories internally, simplifying the process of creating and maintaining them, and allowing them to contain more useful and relevant information for internal developers will help agencies develop best practices, learn from AI implementations elsewhere in the agency, and accelerate adoption.

Prepare the Federal Workforce to Succeed with AI. AI transformation is not just a technological change, it is also a cultural and organizational shift. While not every federal worker will need deep technical skills, training that enables effective human-machine teaming and helps workers understand how AI can be applied to their missions and maximize its value will be essential. To prepare the federal workforce to succeed with AI and enable AI innovation in government, the AI Action Plan should:

- **Establish an AI Literacy Curriculum:** The curriculum should be broad enough to be relevant to all federal workers, covering everything from AI basics to training programs for workers using specific AI technologies and applications in their jobs. For example, courses on generative AI (gen AI) fundamentals and prompt engineering could be made available to all federal workers; managers could receive training on driving adoption and scaling gen AI and leading teams in the age of gen AI; and senior leaders should have access to training on business impacts, agency-specific use cases, adoption and scaling and leading in the age of gen AI.
- **Create Programs and Incentives for Upskilling:** Create programs and incentives for technical workers to gain relevant certifications or nanodegrees and participate in continuing education programs to expand their AI skills.
- **Expand Exchange Programs and Temporary Placements:** Federal agencies are facing a skills gap for technical expertise. What limited technical expertise exists needs to be shared across agencies and efforts should be made to expand programs like temporary placements (e.g., IPAs), which can operate across agencies and components and bring technical expertise to fill gaps.
- **Prioritize Hiring the Right Workers and Streamline Hiring Authorities:** The federal hiring process takes too long, and federal agencies are already at a hiring disadvantage compared with the private sector due to federal salary constraints. The administration should direct agencies to prioritize hiring AI and data science skills and workers with experience using AI. Greater emphasis should be placed on skills-based hiring, as well.

Invest in Data Readiness and Prioritize AI-Enabling Data Architectures. Data readiness is essential to accelerating AI adoption in federal agencies, but federal data architectures in many cases remain siloed and antiquated. By having well-organized, clean, and accessible data, agencies can more effectively train and deploy AI models, reducing the time and resources needed for data preprocessing and integration, thereby lowering costs. Enhanced data readiness also enables more efficient workflows and decision-making processes, driving greater operational efficiency.

- ***Invest in Data and AI Platforms to Integrate Diverse Data Sources:*** Agencies should have data and AI platforms to streamline data discovery and access management. These platforms should include metadata repositories that integrate data catalogs across multiple data systems and provide natural language search and context-aware recommendations for data scientists and engineers. These metadata repositories lay the foundation for the use of agentic AI solutions.

Define a Government-Wide AI Policy, Including Voluntary Safety Standards. Agencies benefit from a unified framework that promotes transparency, accountability, and safety, thereby fostering public trust in AI systems. A clearly defined voluntary standard of care can help unlock innovation by enabling responsible risk taking. This approach not only safeguards national security and public welfare but also positions the government as a leader in setting high standards for AI practices.

- ***Establish a Voluntary Minimum AI Safety Standard for Federal Agencies:*** Direct NIST to establish a voluntary minimum AI safety standard for federal agencies, based on the NIST AI Risk Management Framework (AI RMF). This standard should establish a common baseline standard of care and set of practices that enhance quality control, performance and reliability and that can be tailored to individual agency needs.
- ***Continue to Develop Guidance on the Application of the AI RMF to Specific AI Technologies and Applications.*** The AI RMF has been widely praised as a generally applicable voluntary framework to guide development and deployment of AI technologies. However, different applications of AI require more nuanced approaches. NIST should continue to partner with the private sector and academia to develop tailored implementation guidance for specific use cases.
- ***Establish AI Flex Teams:*** Agencies should establish AI flex teams that can support business units and mission centers and help them implement new AI solutions responsibly.

2. SUPPORT AMERICAN-MADE AI FOR BROAD-BASED ECONOMIC PROSPERITY

Domestic Production of Tech, Products and Services. To safeguard American national and economic security and continued technological leadership, the U.S. should prioritize domestic production across all aspects of the AI tech stack, from data centers to semiconductor chips to AI-enabled products and services.

- ***Continue Funding Tech Hubs:*** The Tech Hubs Program aims to strengthen U.S. economic and national security with investments in regions across the country. The program brings together diverse public, private, and academic partners into collaborative consortia focused on driving regional growth. With their existing innovation assets as a foundation, these Tech Hubs will create regional economies around AI; build the workforce of the future; enable businesses to

start and scale, particularly in underemployed and deindustrialized communities;ⁱ and develop and deploy critical and emerging technologies.

- ***Work with Congress to Pass Permitting Reform and Enhance Leverage of All Energy Sources:*** AI innovation requires an increasing amount of energy to power data centers, estimated to consume up to seven percent of U.S. electricity by 2028. Achieving the ambition of AI leadership requires reducing the time and effort required currently to bring online new energy sources and capacity. Between equipment backlogs, permitting delays and construction, it currently takes a decade or longer to bring a new nuclear facility online. AI can itself be a part of the solution—to accelerate permitting review processes, coordinate interagency reviews, and streamline state, local and federal requirements. AI also can speed up feasibility studies, leveraging gen AI to automate parts of the study development and improving document management capabilities. In addition, the administration should work with Congress to accelerate interconnection timelines by simplifying data center grid interconnection processes and pass permitting, licensing and interconnection policy reform to enable new generation and transmission capacity in an expedited manner. The administration should also provide certainty and safe harbor for tax credits under Section 48E and 45Y.
- ***Codify and Expand the National AI Research Resource for “Little Tech” and Refocus Government-Funded Basic Research:*** AI holds tremendous potential for enhancing the work of startups, but developing, training, and operating leading edge AI models can be cost-prohibitive, particularly for small and medium-sized enterprises (SMEs). The National AI Research Resource (NAIRR) provides these critical resources for AI researchers that sow the seeds for the next round of U.S.-led development in AI applications. Simultaneously, the administration should prioritize funding for government-funded research institutions such as the National Science Foundation (NSF) and DARPA to drive innovation that can later be commercialized. Federal funding of early stage, pioneering scientific AI research is essential and relied upon by industry. The commercial applications of early-stage research are not always readily apparent – and therefore not an attractive investment to industry – but it forms the building blocks of our world-leading innovation economy.

3. ENSURE THAT THE U.S. HAS A WORLD CLASS, AI-READY WORKFORCE

As AI becomes more ubiquitous, jobs across all industries increasingly require a level of AI fluency. Without action, the current skill demand-supply gap will grow, stifling progress. Therefore, along with maintaining the conditions fundamental to innovation, such as access to capital and data and a robust research and development ecosystem, the U.S must focus on maintaining the world’s best pipeline of talent that is AI-ready, digitally fluent and agile. In addition, the U.S. government (at the federal, state and local level) must work together with industry to provide job pathways for the untapped talent across America, including those without traditional four-year degrees, and support education and skilling programs for American students and workers so that they can thrive in the AI economy of the future. To that end, the U.S. government should:

Support Industry-Led Reskilling and Upskilling. Businesses are at the forefront of reinventing work as they adopt AI across their enterprises. In the process, they are redefining the skills and competencies

that will be required for the future AI-powered workforce. To enable their success and the success of American workers, the administration should:

- **Support Skilling Through Tax Incentives:** Given the pace of technological change, companies need to invest in a constant learning loop as technology evolves. We recommend incentivizing employers to train their employees on much-needed AI skills, including through initiatives like the *Upskilling and Retraining Assistance Act*ⁱⁱ that would expand the tax exclusion for employers to cover educational training programs.
- **Develop an AI Workforce Impact and Opportunity Tool:** Create an advanced, predictive analytics tool designed to support American employers—including small and medium-sized enterprises (SMEs)—in anticipating, evaluating, and proactively managing AI’s impact on their workforce. Key features would include scenario modeling capabilities that illustrate job redesign possibilities, skilling pathways, and associated return-on-investment (ROI) insights. The administration could consider, for example, developing a next generation of the Department of Labor’s existing Occupational Information Network (O*NET) database, integrating analytics and AI into O*NET’s rich occupational data. Simplifying and clarifying workforce planning will empower businesses to make strategic decisions about resource allocation, talent pipeline development, and targeted training investments, ensuring American workers are well-equipped to excel in an AI-driven economy.
- **Support Expansion of Next Generation Apprenticeships:** Traditional apprenticeships have focused on the trades, but apprenticeships have tremendous potential to prepare people for in-demand knowledge roles and use of emerging tech like AI, including in strategic areas like semiconductor manufacturing. Apprenticeships also allow access to broader pools of talent—e.g., youth, those without four-year college degrees, those from underserved or forgotten communities—and have the advantage of getting people and skills into the workforce quickly through an earn-as-you-learn approach. The federal government can encourage greater use of apprenticeships, including those outside of the Registered Apprentice Program, by streamlining the burdensome process of accessing training funds available to the states, for example, through the *Workforce Innovation and Opportunity Act*.

Focus on the Future of AI Education. The U.S. currently lags China and India in the number of STEM graduates and the percentage of STEM graduates that go into STEM-related fields.ⁱⁱⁱ Addressing this gap will require a focus not just on higher education, but also on increasing the introduction of AI as part of K-12 education. The Bipartisan House Task Force on AI cited the need to invest in K-12 STEM and AI education, along with more resources for educators.^{iv}

At least eleven countries have implemented AI curricula for K-12, including China, India and the UAE, with several others in development.^v In the U.S., Florida provides a good state-led example that others could replicate. It implemented a K-12 AI education program based on a curriculum designed by the University of Florida. Starting with kindergarten, the program establishes learning standards for AI courses in Florida's classrooms.^{vi}

- **Encourage and Coordinate Industry and Academia-Led Educational Tools for Students and Teachers:** The administration should convene a national summit on the future of work, inviting

industry leaders and higher education institutions to collaborate and commit to providing free AI educational tools, curricula, and resources to classrooms. While some initiatives currently exist, the administration can play an essential coordinating role, ensuring these resources reach communities nationwide, especially in exurban and rural areas. These regions often have limited connectivity with AI-driven companies and universities yet stand to significantly benefit from targeted efforts addressing the impacts of economic transformation and deindustrialization.

- ***Incentivize K-12 AI Curriculum Development Leveraging Local, State and Federal Resources:*** Encourage states to follow Florida’s model and work with their public university systems to develop K-12 AI education programs, leveraging the guidelines established by the NSF and the Association for the Advancement of Artificial Intelligence.^{vii} While a focus on STEM is necessary, it is not sufficient; AI education should also focus on critical thinking and problem-solving skills, enabling a deep understanding of technology and fostering creativity and agility to support future innovation.

Launch an AI Literacy Campaign: Implement national AI preparedness and education initiatives, including deepfake awareness, to inform the public about the benefits and risks of AI. As an example, Accenture launched the First AI-ID Kit, a deepfake awareness training, which is mandatory for our 800,000 people and available to the public as a resource.^{viii}

4. CREATE AN ENVIRONMENT TO MAXIMIZE AI INNOVATION AND ADOPTION

Adoption of AI across the private sector will increase U.S. companies’ productivity, efficiency and growth and, with it, U.S. competitiveness. Yet, adoption currently is lagging.^{ix}

The private sector has a vital role to play in establishing trust and confidence in AI^x, but the government can foster greater AI adoption and innovation by creating a clear and consistent policy environment that is pro-innovation, incorporates industry expertise, includes guardrails for the highest risk uses and retains flexibility as AI evolves over time. While some areas may require new laws, in many cases, existing laws and industry regulations can be applied or adjusted.^{xi} Outside of these areas, the administration should encourage where possible voluntary compliance with frameworks like the AI RMF.

At the same time, however, we are seeing a proliferation of proposed or enacted state laws—over 780 state laws proposed this year so far—that threaten to slow down and increase the complexity and cost of AI innovation and adoption across the country.^{xii} Federal action is needed to preempt such laws.

Likewise, the lack of a federal data privacy law has left us with a patchwork of state laws, leading to burdensome compliance requirements and a lack of clarity for American companies on the collection and use of consumer data. Currently 19 states have their own privacy laws, with 12 more already introducing privacy legislation this year. Data is the fundamental building block for AI development, so this patchwork also is creating unnecessary compliance burdens, particularly harmful for innovative startups.

To maximize the adoption of AI in the private sector, the U.S. government should:

- **Work with Congress to Address State AI Laws:** The administration should consider a federal AI law that preempts the growing number of state AI laws. Legislation could include clear standards of care based on voluntary frameworks like the AI RMF and address high-risk use cases, where appropriate. There are options and considerations for the precise scope and approach to preemption, which the Bipartisan House Taskforce on AI outlined well.^{xiii}
- **Use Policy Prototyping To Remove Barriers for Industry Modernization and Incentivize Adoption of AI Governance Frameworks, Training Data Auditability and Red Teaming:** The administration should incentivize adoption of AI governance frameworks and digital modernization by utilizing policy prototyping tools like regulatory sandboxes, developing industry-specific model governance frameworks and using contracting provisions and other regulatory feedback mechanisms to provide the private sector with the guidance needed to modernize their businesses.
- **Work with Congress to Pass a Federal Data Privacy Law that Preempts State Laws:** A federal privacy law that preempts all state laws is critical to maintaining U.S. leadership in AI. Congress should work with industry to understand the impacts and tradeoffs of the varying state laws and put a federal privacy law together based on the best components of each.
- **Encourage the Development of Privacy Preserving Compute Ecosystems:** When it comes to training data sets with sensitive data, it can be difficult to obtain the required permissions from users at the individual level. To continue data training uninhibited, the administration should encourage the use of data via privacy preserving compute, which allows companies and other organizations to train on a large data set without ever observing the actual data.

5. MAINTAIN U.S. LEADERSHIP IN GLOBAL AI STANDARDS

America's ability to lead on AI globally will be determined, in part, on its ability to promote consistent, interoperable standards around the world. To reinforce the competitive position of U.S. companies in international markets, the administration should:

- **Use U.S. Convening Power and "Tech Diplomacy" to Advance International AI Standards.** U.S. export markets should have common standards, rules and regulations that allow for U.S. companies to compete fairly in those markets. The administration should leverage international standards-setting organizations like ISO and fora like the OECD and the G7 to support the development of international AI standards on AI security, quality control, performance and reliability that are based on, and interoperable with, U.S. frameworks and standards.

CONCLUSION

Accenture and AFS are committed to supporting the U.S. government's efforts to develop a comprehensive AI Action Plan. These recommendations underscore the critical importance of U.S. leadership in AI innovation, development, and adoption. Drawn from our extensive experience in both private and public sectors, these proposals emphasize securing the U.S. AI industrial base, developing workforce expertise, fostering an environment conducive to broad AI adoption, transforming government operations with AI, and maintaining the U.S.' global leadership in AI.

By implementing the right policies and making strategic investments, the United States has a unique opportunity to lead the world in AI. This leadership is vital to driving economic growth, enhancing

national security, and improving public services. Collaboration among government leaders, businesses, and academic institutions will be essential to ensuring AI becomes a powerful catalyst for progress and global competitiveness. Together, these efforts will help build an AI-driven future that benefits all citizens and solidifies America's position at the forefront of this transformative technology.
