

Artificial Intelligence (AI) Action Plan Submission from Lazarus Enterprises Inc.

Official Company Name: Lazarus Enterprises Inc.

NAICS Code: 541715 - Artificial intelligence research and development laboratories or services. Per NAICS 541715, a company under 1,000 people is considered a small business.

<https://www.census.gov/naics/?input=Artificial+Intelligence&year=2022&details=541715>

Author: Adam Hayes

Bottom Line Upfront (BLUF) Summary:

1. Infrastructure & Supply Chain Resilience

- **GPU Investment & Modernization:** The DoD must invest in and continuously modernize GPU infrastructure across all classification levels to support scalable AI model deployment, ensuring the U.S. maintains a technological edge over adversaries.
- **Cloud & Edge Computing:** Secure, scalable cloud solutions and edge computing capabilities must be expanded to enable real-time AI processing at the point of need, mitigate impacts in DDIL situations, thus reducing latency and enhancing operational responsiveness.
- **Continuous ATO & Path to Production:** Streamline AI system deployment by automating security and compliance checks, leveraging path to production models like 2nd Front Systems' Game Warden to rapidly integrate AI solutions while maintaining security.
- **Agile & DevSecOps Adoption:** Expand the use of CI/CD methodologies across the DoD, mirroring the success of JIDO's rapid AI deployment to ensure iterative improvements and battlefield readiness.

2. Workforce & Small Business Engagement

- **Eliminate Bureaucratic Barriers:** The DoD must streamline contracting processes to allow non-traditional defense contractors and small businesses to compete, reducing redundancies that discourage innovation.

- **Transparency & Accessibility:** A unified digital entry point should replace fragmented government systems, offering an accessible, automated platform to facilitate engagement with the DoD.
- **Faster Payments & Viability:** AI-driven automation must be leveraged to expedite payments, ensuring small businesses can sustain operations without waiting months for revenue realization.
- **Cost of Entry Reality:** Small businesses currently face an average upfront cost of \$130K+ before generating revenue with the DoD. Reducing these barriers will drive innovation and ensure the best technologies reach the warfighter.

3. AI-Driven Innovation & Collaboration

- **Real-Time AI Information Sharing:** The DoD must move away from siloed, outdated data repositories and establish a centralized, AI-powered database aggregating information on ongoing projects, contracts, and research initiatives.
- **Bleeding-Edge AI Capabilities:** Agent-based and multimodal AI systems are already a reality, and our adversaries are actively investing in similar technologies. However, most DoD AI project approaches are fundamentally flawed—they are chasing capabilities that are quickly becoming commoditized, rather than focusing on the true next-generation advantage. The U.S. cannot afford to make the same mistake, but we are hindered by the slow processes we have in place currently.
- Simply deploying multimodal systems—AI models processing text, imagery, signals intelligence, and sensor data—is not enough. The real strategic advantage lies in the ability to orchestrate, analyze, and seamlessly fuse multimodal data into a unified decision-making framework to inform leaders.
- **Integrated Collaboration Platforms:** Secure digital environments should facilitate seamless collaboration between government agencies, industry partners, and research institutions, ensuring AI developments are rapidly fielded and iterated.

4. AI Risk Mitigation & Security

- **Proactive AI Threat Intelligence:** The DoD must create an integrated AI-driven threat intelligence platform that aggregates real-time data across agencies to detect and counter adversarial AI exploitation.
- **Multi-Agent AI Defense Systems:** Advanced AI models must be deployed to interpret and respond to cyber and operational threats, leveraging machine-speed analysis to stay ahead of adversaries.
- **Real-Time Security Alerts:** AI-powered threat detection must replace slow, outdated manual monitoring, ensuring immediate, actionable responses to potential security risks.

5. Acquisitions, Policy & Regulatory Modernization

- **AI for Procurement & Compliance:** The DoD must leverage AI to automate acquisitions, budget planning, and contract management, reducing delays and ensuring compliance without manual bottlenecks.

- **Transparency & Accountability:** AI-driven audit and tracking mechanisms must be implemented to enhance visibility in procurement processes, ensuring ethical and strategic spending.
- **Accelerated Capability Deployment:** Expanding OTA mechanisms, marketplace platforms like Tradewinds, and AI-driven acquisition models will drive faster integration of critical defense AI technologies.
- **Competitive Edge Over Adversaries:** The U.S. must abandon outdated, bureaucratic acquisition strategies that slow AI adoption, enabling a transition to adaptive, AI-driven decision-making to maintain superiority over peer threats.

6. AI for Supply Chain & Compliance

- **Automated AI-Driven Acquisition Processes:** AI must be used to interpret and execute procurement and regulatory workflows, eliminating inefficiencies that slow down innovation.
- **Data-Driven Decision Making:** AI analytics must replace outdated decision-making frameworks, ensuring data-informed strategies that maximize efficiency and resource allocation.
- **Human-Machine Teaming:** AI should augment acquisitions, compliance, and supply chain management, reducing cognitive workload while maintaining human oversight for strategic direction.

Bottom Line: The DoD must pivot to AI-driven transparency, efficiency, and innovation to counteract outdated methodologies that place the U.S. behind peer adversaries. By integrating bleeding-edge AI capabilities, modernizing infrastructure, and streamlining processes, the U.S. can outpace competitors and ensure technological superiority in defense applications.

Overview

The Department of Defense (DoD) must strategically invest in foundational infrastructure, streamline acquisition processes, and promote interagency collaboration to enhance the Defense Industrial Base (DIB) and effectively integrate AI technologies into defense systems. By fostering innovation, simplifying procedures, and ensuring timely information sharing, the DoD can accelerate AI adoption, mitigate risks of adversarial exploitation, and enhance overall defense capabilities. Key initiatives should focus on modernizing technological infrastructure, supporting non-traditional defense contractors, promoting collaboration, and leveraging AI to streamline acquisitions and regulatory compliance.

Assembling the Right Team: People as the Cornerstone

The culture of this evolving AI ecosystem is defined by its people, whose collaboration, leadership, and accountability are the foundation of success or failure. A truly adaptive and responsive environment depends on the right mix of expertise and commitment from individuals across government, industry, and academia, each advancing the AI ecosystem's continuous evolution.

This begins with a core government team who creates, maintains and protects the AI ecosystems culture, drives the mission forward, champions innovation, and skillfully navigates the procurement landscape to enable rapid fielding. Equally essential are industry partners, who bring technical expertise and a commitment to clearly defined, mission-critical goals. Trust and respect across all partners are fundamental, as seen in JIDO's success, where key leaders collaborated with a shared vision, supporting one another and fostering an AI ecosystem that consistently met mission requirements. This decentralized, well-balanced team approach enables agile and decisive execution, ensuring the AI ecosystem adapts at the speed of evolving threats.

Embracing Continuous Improvement: An Iterative Development Process

Once the right team is in place, the AI ecosystem grows and evolves through a continuous, iterative process. Feedback loops and close collaboration across organizations enable the team to refine solutions incrementally, ensuring they remain responsive to real-time operational needs and field insights. This iterative approach allows for rapid adaptation and improvement, ensuring that fielded solutions can meet the demands of evolving threats and user feedback, keeping the AI ecosystem relevant and effective.

Leveraging Core Technologies: The Foundation for Agility and Speed

At its foundation, this AI ecosystem relies on core technologies that streamline and enhance people and process efficiencies. Technologies such as AI, Continuous Integration and Continuous Delivery (CI/CD) pipelines, automated testing and deployment, and secure sandbox environments allow for seamless updates, rapid validation, and deployment at speed. These capabilities enable the AI ecosystem to function as intended: providing mission-capable solutions that evolve at the pace of threats.

In summary, the first critical step is ensuring the RIGHT people are aligned across government and industry. From there, an iterative and feedback-driven process, supported by robust core technologies, enables this AI ecosystem to adapt and deliver solutions at the speed demanded by an ever-evolving threat landscape. With these elements in place, the AI ecosystem achieves its core mission—offering agile, effective, and mission-ready capabilities when they are needed most.

An Adaptive Framework: Meeting Mission Needs at the Speed of Threats

The framework underpinning this evolutionary model must be purpose-built to meet the urgent demands of today's dynamic threat landscape. Unlike traditional acquisition processes, which are often encumbered by lengthy timelines and rigid structures, this framework must continuously evolve to ensure material solutions are fielded swiftly and aligned with real-time requirements from end users. Its core mission is to close capability gaps at the speed of need, prioritizing operational relevance over procedural formality.

This model's flexibility allows for rapid integration of new technologies and iterative refinement based on feedback from the field, ensuring that solutions are not only deployed quickly but are also optimized for immediate impact. By incorporating continuous delivery mechanisms and streamlined authority-to-operate protocols, the framework enables rapid deployment cycles, ensuring that new capabilities can be securely fielded and iterated upon in hours, not months.

Ultimately, this adaptive framework replaces outdated acquisition processes that struggle to keep pace with evolving threats. Instead, it delivers a responsive, user-focused approach designed to provide operators with mission-ready tools precisely when they are needed, supporting agile and effective responses to ever-changing challenges.

To effectively maximize the utilization of current acquisition policies, methodologies, and pathways, it is imperative to have a dedicated team that embodies creativity and innovation. With the right people, robust support, and cutting-edge technology, it is not only feasible but also executable to create a responsive and adaptive AI ecosystem capable of addressing evolving challenges. By fostering a collaborative environment that empowers team members to leverage

existing frameworks and think outside the box, we can unlock the full potential of our acquisition processes to deliver timely and effective solutions.

Historical Successes in Rapid Adaptation

Case Study: Joint Improvised Threat Defeat Organization (JIDO)

The Joint Improvised Threat Defeat Organization (JIDO), established during the Iraq and Afghanistan conflicts, exemplifies the potential for rapid, user-driven response frameworks. Confronted with the challenge of improvised explosive devices (IEDs) and explosively formed projectiles (EFPs), the DoD created JIDO to respond to these threats quickly and effectively. JIDO:

- Created prototypes for countermeasures in direct response to warfighter feedback.
- Employed flexible funding to expedite solution testing, procurement, and deployment.
- Developed solutions that evolved from electronic countermeasures to innovations like V-shaped hulls for increased vehicle survivability.

JIDO's success was largely due to a highly responsive feedback loop, where warfighters provided insights that directly shaped technological advancements.

- **Agile and Iterative Development:** JIDO implemented an agile methodology that allowed rapid development and adaptation of counter-IED technologies and techniques. This iterative development process, based on continuous evaluation and refinement, meant that solutions could be quickly tested and adjusted to address specific battlefield challenges. The organization's flexibility allowed it to move from concept to prototype to fielded solution in a fraction of the time required by traditional acquisition processes.
- **Cross-Functional Teams of Experts:** JIDO's framework included a coalition of dedicated experts from government, industry, and the military who brought diverse skills and insights. Each organization within JIDO's network served a distinct role, ensuring all critical requirements—from technology development to field integration—were met in one cohesive team. This team-based, multi-disciplinary approach enabled JIDO to address every aspect of solution deployment, including research, engineering, manufacturing, and logistics.
- **Rapid Prototyping for Operational Solutions:** Central to JIDO's strategy was its ability to rapidly develop, test, and deploy operational prototypes in the field. By focusing on rapid prototyping, JIDO could create solutions that were not only innovative but also practical for immediate operational use. This enabled the organization to produce countermeasures that were both timely and adaptable, providing the warfighter with tools that could meet the pace of evolving threats.
- **Short Feedback Loops with End Users:** JIDO's framework prioritized continuous communication with end users—soldiers and commanders actively engaged in combat.

This close feedback loop allowed JIDO to gain firsthand insights into the effectiveness of its solutions and make necessary adjustments. Direct input from the field informed rapid iterations and improvements, ensuring each prototype was honed based on real-world usage rather than theoretical assumptions.

- **Flexible Funding and Acquisition Processes:** JIDO's ability to access flexible funding streams, often referred to as "colorless money," allowed it to move quickly and avoid the lengthy budgeting cycles that typically hinder defense acquisition programs. This agile funding model, combined with streamlined acquisition processes, ensured JIDO could procure, develop, and deploy technologies without bureaucratic delays.
- **Collaboration with Industry and Academia:** JIDO actively engaged with industry and academia to leverage cutting-edge innovations and research. By collaborating with external partners, JIDO was able to accelerate development timelines, access new technologies, and integrate leading-edge solutions into its counter-IED efforts. These partnerships allowed JIDO to stay ahead of adversaries by incorporating the latest advancements into its toolset.

Recent Precedents: Ukraine Conflict

The Ukrainian conflict provides another recent example, where the rapid adaptation of tactics, techniques, and technology has been critical in countering aggressive forces. This dynamic battlefield has underscored the need for timely intelligence, agile technological adaptation, and an AI ecosystem that enables rapid deployment. Emulating this adaptability through a framework informed by end-user data and real-time feedback is essential to ensuring preparedness in future conflicts.

Direct and Continuous Feedback from End Users for User-Centered Design

A critical component of the evolutionary model is the establishment of a robust and constant feedback mechanism directly from end users, which is already a core component within the DoD software acquisition pathway. This approach is essential for enabling user-centered design, prioritizing the needs and experiences of those who will be employing the technology in real-world scenarios. End users possess invaluable insights into the effectiveness of capabilities as they continuously evolve their tactics, techniques, and procedures in response to emerging battlefield threats.

The integration of direct and iterative feedback into the software acquisition pathway allows for rapid adjustments and refinements to be made, ensuring that solutions are not only functional but also intuitive and user-friendly. This iterative nature contrasts sharply with traditional, slow-moving requirements generation processes that have historically struggled to keep pace with the speed and scale of operational needs.

By fostering a culture of direct user engagement, organizations can ensure that the design and development processes align closely with the realities faced by warfighters. This responsiveness enables teams to identify gaps in capabilities more swiftly and accurately,

leading to the creation of more effective and relevant solutions. Ultimately, this enhances mission success on the battlefield.

Empowering end users to contribute their perspectives throughout the development cycle reinforces the adaptability of the evolutionary model. By integrating user feedback into the design process, the software acquisition pathway not only evolves in tandem with changing conditions but also improves the overall effectiveness of the technology being deployed.

In summary, the inclusion of direct and additive feedback from end users is paramount to developing user-centered solutions within the software acquisition pathway, ensuring that the military can respond effectively and efficiently to challenges as they arise in an increasingly dynamic threat landscape.

Flexible Contracting and Budgeting Mechanisms for Rapid Iteration

For an adaptive and responsive defense AI ecosystem to succeed, it must be underpinned by both flexible contracting mechanisms and a flexible budgeting process. Traditional PPBE processes, often rigid and slow-moving, cannot keep pace with the dynamic threat environment and the rapid evolution of technology. To address this, flexible mechanisms—such as Colorless money, Other Transaction Authorities (OTAs), Basic Ordering Agreements (BOAs), and similar frameworks—are critical to enable the swift onboarding of new partners, technologies, and innovations.

Flexible contracting models allow government organizations to bypass many traditional barriers in acquisition, expediting partnerships, developmental work, and access to advanced solutions. OTAs, for example, provide streamlined pathways for engaging with innovative tech firms and non-traditional defense contractors, which is essential for securing specialized expertise and addressing urgent capability gaps with emerging technologies. Through BOAs, organizations simplify ordering processes, ensuring they can quickly access a suite of pre-approved partners and solutions. This framework supports rapid scaling, enabling government teams to respond quickly to newly identified threats with the right mix of capabilities.

Complementing these contracting mechanisms, a flexible budgeting process is equally crucial. Instead of the historical, often restrictive budget approach, a more adaptable funding strategy should be established to allow for dynamic reallocation of resources as threats evolve and new requirements emerge. With a flexible budget, agencies can quickly redirect funding to support high-priority areas, accelerate development cycles, and continuously refine technologies based on real-time needs. This approach ensures that funding can move at the speed of need, driving mission impact and facilitating rapid transitions from prototype to deployment.

Together, flexible contracting and budgeting create a foundation for agile, iterative development cycles where capabilities can be rapidly prototyped, delivered as Minimum Viable Products (MVPs), and field-tested for end-user feedback. This feedback loop, supported by agile budget adjustments, enables continuous improvement and adaptation, ensuring that solutions are

refined to meet real-world operational demands. The combined flexibility in contracting and budgeting mechanisms is essential for aggregating and responding to evolving threats dynamically. By supporting faster cycles of problem identification, MVP development, and iteration based on field feedback, this approach accelerates time-to-mission-impact, building a resilient, scalable AI ecosystem capable of addressing emerging challenges with precision and speed.

Leveraging On-Premises, Private Cloud, and Secure Commercial Cloud Environments for Scalability and Cost Efficiency

A critical element supporting the evolutionary model is the strategic use of on-premises infrastructure, approved commercial cloud environments, and / or hybrid architectures. This architectural approach enables organizations to manage costs effectively while maintaining access to the latest hardware, infrastructure scalability, and failover redundancies essential for rapid adaptation. By leveraging a hybrid environment that integrates on-premises and cloud resources, organizations can flexibly scale capabilities as needs evolve, ensuring the ability to support both short-term operations and long-term strategic goals.

This approach also allows organizations to stay current with technological advancements, ensuring compatibility with the evolving marketplace of data and artificial intelligence (AI). On-premises solutions can provide secure, immediate access to data for sensitive workloads, while private and commercial cloud environments offer scalability and rapid processing power to support AI-driven insights and large-scale data operations.

By balancing the strengths of on-premises and cloud resources, organizations can maximize both cost-efficiency and adaptability, enabling continuous improvement in data handling, AI integration, and infrastructure resilience. This flexibility is essential in today's environment, where an evolving threat landscape requires rapid innovation and robust data-driven solutions.

Rapid Validation and Deployment of Software Solutions

A crucial component of this adaptive framework is the capability to rapidly assess, validate, and deploy software solutions using a continuous integration and continuous development (CI/CD) pipeline. This approach, combined with secure sandbox environments, enables the government to validate software performance and reliability using real-world data within a protected environment. Through these mechanisms, decision-makers can gain high-fidelity insights into how solutions will perform operationally, allowing for data-informed decisions paired with rapid deployment into live operational networks.

The CI/CD pipeline and sandbox environments facilitate a streamlined process in which software updates, iterative improvements, and new features can be delivered continuously. This agile approach enables a responsive cycle for integrating software into operational systems, achieving immediate mission impact without the delays typically associated with traditional software rollouts. Furthermore, these environments allow for continuous cybersecurity monitoring and threat mitigation, enhancing the resilience and security of deployed solutions.

This methodology has proven successful at scale within the U.S. intelligence community. For example, the National Geospatial-Intelligence Agency's (NGA) Unclassified Data Lake and JIDO's Attack the Network suite have demonstrated how these methodologies can validate, enhance, and deploy mission-critical software at the speeds required. These initiatives leverage

real-world data in secure settings to simulate operational use, accelerating the fielding of software solutions that directly support mission requirements.

This ability to deploy rapidly, paired with

iterative updates informed by continuous feedback, is essential to maintaining a technological edge and responding at the speed of evolving threats.

Rapid Adoption and Integration of New Hardware with Edge AI Capabilities

A vital component of this adaptive framework is the ability to quickly adopt, integrate, and deploy new hardware components, particularly for use in edge environments and Denied, Disrupted, Intermittent, and Limited (DDIL) situations. Such environments are prevalent in intelligence and special operations, where maintaining operational effectiveness despite challenging connectivity conditions is paramount. Integrating hardware with complementary software solutions—and increasingly, with artificial intelligence (AI) capabilities—enables rapid, data-driven decision-making in the field.

The Army's Common Hardware Systems (CHS) contract methodology provides a streamlined approach to access a diverse array of ruggedized COTS, field-tested hardware solutions through a prime integrator. This access enables government teams to quickly procure validated hardware that meets rigorous military standards, supporting swift deployment and reducing procurement timelines. Through CHS, agencies can adapt and deliver hardware optimized for military environments, offering the durability and reliability needed in high-stakes scenarios.

As the scale and capability of AI continues to advance, the availability of high-performance GPUs is essential to enabling AI models to operate effectively on edge devices. This advancement is particularly important as AI models are developed to support various warfighting functions, including real-time threat analysis, reconnaissance, and autonomous decision-making. By deploying AI-enabled hardware on the edge, operators gain immediate access to insights and capabilities that enhance situational awareness, support mission-critical functions, and enable autonomous responses in real-time.

The combination of advanced, DDIL-resilient hardware and edge-capable AI models creates an adaptive, self-sustaining AI ecosystem that allows for continuous improvements. This approach maximizes the impact of AI and other data-driven technologies on the battlefield, supporting both immediate and long-term operational effectiveness. The integration of these solutions through agile, continuous pipelines is essential for achieving mission outcomes at the speed of evolving threats.

Testing and Evaluation as Drivers of Evidence-Based Capability Adoption

A crucial element of this evolutionary model is the role of testing and evaluation in driving evidence-based, data-informed capability adoption. To be effective, rapid developmental and operational testing, by end users, must validate new capabilities swiftly and accurately, reducing the risks associated with deploying unverified solutions. This rigorous testing approach ensures that only capabilities meeting mission needs and end-user requirements advance to fielding, allowing for practical and reliable solutions in real-world environments.

However, the success of this approach relies on test organizations that are not only thorough but also highly responsive. To avoid the delays often seen in traditional acquisition processes, these organizations must be able to plan and execute well-formed test events in a timely manner. This agility enables a smoother pathway from capability development to deployment, ensuring that testing complements rather than slows the pace of innovation.

In this framework, procurement decisions can also be informed by evidence-based testing outcomes through independent test organizations. By grounding acquisition in performance-based evidence, these assessments reduce reliance on claims from proposals alone, thus lowering the risk of adopting impractical or unsuitable solutions. This streamlined

testing and evaluation process supports the agile fielding of viable, mission-capable capabilities that can adapt to changing operational needs and threats.

Enabling Secure, Agile Collaboration through Distributed Classified Solutions

A network of secure Nooks spaces, complemented by government programs for distributed classified workstations and mobile devices, can significantly enhance agile communication and software delivery within classified environments.

Key components include:

1. **Classified Workspaces:** Nooks offers secure environments to protect sensitive projects, enhancing national security while enabling cross-sector innovation.
2. **Seamless Government-Industry Collaboration:** Nooks facilitates partnerships that accelerate technology adoption and secure information sharing, creating a bridge between government and industry.
3. **Rapid Technology Integration:** For government agencies, Nooks streamlines the adoption and deployment of new technologies, broadens vendor access, and taps into specialized talent in secure environments.
4. **Distributed Classified Workstations and Mobile Devices:** Government-supported mobile and distributed workstation solutions enable secure, flexible access to classified networks, enhancing field agility and mission responsiveness.
5. **Industry Advantages:** By reducing operational barriers, Nooks empowers private sector partners to engage in classified work faster, more cost-effectively, and within secure settings.
6. **Clearance Support:** Nooks assists in obtaining facility and personnel clearances, expediting the onboarding of secure partners essential for rapid mission support.

Together, Nooks spaces and distributed classified solutions foster swift, secure collaboration and software deployment, integrating agility and security to meet evolving mission needs.

Adoption and Utilization of Multimodal Artificial Intelligence Models for Enhanced Decision-Making

One of the Department of Defense's (DoD) most pressing challenges today lies in the sheer volume and complexity of data that is constantly expanding. The current human analytical workforce is unable to ingest, correlate, and interpret this information fast enough to fully “sense and make sense” of the operational environment. With the rapid development of artificial intelligence (AI) capabilities, particularly those geared towards identifying and tracking threat actors globally, the DoD must be prepared to assess, validate, and deploy AI models that can effectively augment human analysts and enable more informed operational decisions.

Leveraging Multimodal Artificial Intelligence for Enhanced Decision-Making:

To adapt to the data demands of today's environment, the DoD needs to integrate a range of multimodal AI models that can manage, analyze, and fuse diverse data types—both structured and unstructured. This approach will enhance decision-making, situational awareness, and operational responsiveness across strategic and tactical domains. AI's role is to “sense and make sense” of vast, complex information landscapes, providing military and defense leaders with actionable insights at a speed and accuracy unattainable by human-only processes.

Ensuring AI Transparency, Adaptability, and Scalability:

For these AI models to be trusted and effective, transparency and explainability are essential to help decision-makers trust and understand the insights AI provides. Adaptability is also critical—AI models must evolve with changing data patterns and threat landscapes. Success depends on secure access to data, pathways for rapid fine-tuning and iterative updates, and continuously modernized infrastructure that can accommodate ongoing advancements in AI.

AI-Driven Evolutionary Model for Real-Time Responsiveness:

The DoD's evolving needs must be met with a similarly adaptive, AI-enabled model. The current AI landscape has demonstrated processing speeds and efficiencies that surpass traditional methods by factors of tens or even hundreds of thousands. By establishing an evolutionary model enabled by AI, the DoD can leverage continuous integration/continuous delivery (CI/CD) pipelines, continuous authority to operate (cATO), and cloud-based infrastructures, ensuring a flexible, secure, and scalable foundation to manage these expanding data and computational demands.

Conclusion: A Dynamic Model for Rapid Capability Delivery

A constantly evolving model empowers the rapid development and deployment of capabilities at the speed of emerging threats. Centered on agile frameworks, continuous user feedback, and flexible acquisition processes, this approach accelerates the delivery of mission-ready solutions. By harnessing AI, CI/CD pipelines, cATO, secure cloud environments, and cutting-edge technologies and modernized hardware, the model ensures swift integration of new technologies and the agility to stay on the forefront of innovation.

Testing and evaluation form the backbone of evidence-based decision-making, ensuring that new solutions are validated for effectiveness while avoiding typical delays. Responsive, independent test organizations support this dynamic approach, reinforcing agile processes and enhancing mission readiness.

With the **RIGHT people, technology, and structural support**, this model, mirroring a validated methodology forged in previous conflicts, can reliably meet the evolving demands of modern warfare, delivering effective, timely capabilities that empower operators and improve mission success across all levels of command.
