Subject: [External] AI Action Plan
Date: Tuesday, March 4, 2025 9:38:18 AM

I am writing to inform you about the development of the Artificial Intelligence (AI) Action Plan, as requested in the Federal Register notice (Document Number: 2025-02305).

- **Self-Efficacy with GTAs on AI**

- My current research focuses on utilizing AI tools for teaching and learning. I have participated in book clubs with faculty members to analyze the challenges and solutions that have emerged regarding AI. I have connected with other academic technologists by presenting my VR meditation research at conferences like the Educational Technology Collaborative (Vogel, 2023). The collaborative published my paper on their website. The professional networking has equipped me with resources to share with my HESA cohort and OSU staff. Sharing these resources has helped me employ multiple frameworks to develop meaningful solutions. For example, a colleague at the conference recommended Joy Boulamwini's book *Unmasking AI*, which discusses the implications of AI on BIPOC communities (2023). As a straight white man, these perspectives enlighten me on how emerging technology can exhibit bias and further marginalize others.

- **Professional Knowledge**

- Writing about digital accessibility allowed me to develop skills in designing research projects with student subpopulations. Understanding students with disabilities at OSU required developing research practices, such as exploring university offices that work with digital accessibility. In the Advanced Student Development course, Orefice provided me with data points from the OSU offices. I researched how OSU's Student Life Disability Services (SLDS) and the Digital Accessibility Center (DAC) support this subpopulation by offering training, resolving complaints, and processing exception requests. I examined how these services function and operate in the context of a large public university. I used my coursework from my cognates, *Understanding Organizations*, to make out a stakeholder analysis grid (Bryson, 2011). Furthermore, the Advanced Development course helped me find literature on the subpopulation of students with disabilities. Patton's Critical Disability Theory (CDT), which discusses how the identities of students with disabilities are complex and may not always be available, helped me understand the complexities of a large university supporting a range of accommodations (2016).

- **Transformation of Professional Knowledge**

- The discourse with my cohort in the Strategies and Leadership class challenged

my viewpoints and enriched my understanding of leadership in higher education. As a straight white male, I initially struggled to understand how people of color navigate their identity when viewed by different races in leadership roles. Hearing from other classmates and their experiences as managers at OSU helped me see their perspectives. As I transition into different roles at the university, I reflect on these discussions, acknowledging how identities shape inputs and how the institution's identity creates the environment. These same conversations intersected in the Educational Law course. My cohort would reference the same issues in both courses, reflecting how the Supreme Court rescinded affirmative action (Howe, 2023) and how the leadership at the university is to move forward. The in-class leadership activities of having dialogue, such as the think, pair, and share posters, have deepened my understanding of educational leadership's complexities and prepared me for future professional challenges.

- **Literature Review**

- Theoretical Framework: Self-Efficacy
- Bandura's seminal work on self-efficacy outlines the concept as a critical factor in behavioral change and its implications for various fields, including education and psychology (1977). The framework is chosen to understand how GTAs in ASC perceive their abilities using AI for teaching and learning. To aid my understanding, I will examine the four sources to multiple modes of induction. Bandura notes that positive feedback can lead to success. Regarding emotional and physiological states, a positive mood bolsters self-efficacy, while negative moods diminish it. I want to see if these self-efficacy patterns arise with the GTAs and the experiences with AI.
- Much of the literature collected does not explicitly capture Bandura's frameworks; however, the research studies the connections between students' emotional states, critical thinking, and precautions regarding AI tools. The challenges of researching AI are due to the rapid change of states and volume of data (Lynch, 2024). In the past three years, academia has developed 28 foundational AI models, while the private industry has produced 108.
- AI and Teaching
- AI tools like Chat Generative Pre-Trained Transformers (GPT) have steadily gained traction in the mainstream since 2018 (Batsaikhan & Correia, 2024). Various scholars are developing and utilizing GPT tools in academia.
- Blooms Taxonomy for the Modern Machine
 - Findings indicate that using Bloom's Taxonomy language paired with AI-generated content challenges students to move beyond validation and encourages seeking additional sources. The students mentioned strategies like those used by knowledge workers, such as refining prompts to obtain more optimized output (Gonsalves, 2024; Lee et al., 2025). Additional research finds that creating assessments where students conduct

presentations and develop multimedia, such as websites (Rudolph et al., 2023).

- Research shows that GTAs reflect on how AI tools generate more responsibilities and pedagogical frameworks while being diligent in revising assessments and educating undergrads on the ethics of AI (Katsanakis, Wang, and Affejee, 2023). Additional scholars call for more research from educators on the role of AI in learning (Carvalho, Martinez-Maldonado, Tsai, Markauskaite, and De Laat, 2022).
- Self-Efficacy and AI in the Classroom for Instructors
- A case study surveying the self-efficacy of 20 education GTAs regarding AI tools found that they are eager to learn how to use these tools but also seek further training and support (Power, 2024). Another study revealed that teaching graduate students to use AI effectively increased their comfort levels from 12% to 60% (Wood & Moss, 2024). Additionally, research indicated that students use AI tools cautiously and doublecheck the generated output (“About the Project,” 2024; Chung et al., 2024; Lee et al., 2025). A thematic analysis survey reviewed data from over 8,000 undergraduates; 32% felt that the university guided them in using AI, 28% expressed fear and 43% felt less intelligent because of AI (2024). Furthermore, scholars argue that educational leadership should prioritize creating formal professional digital literacy programs instead of merely emphasizing the implementation of AI policy (Baskara, 2025).
- Brave New World of Academic Integrity
- Educators took a direct approach to teaching their students about the ethics and limitations of using AI tools, and they found that ten out of twenty students did not view their final work with AI as cheating (Fyfe, 2023). Scholars identify a research gap regarding AI tools used by GTAs in their dual roles of teaching and learning (Katsanakis, Wang, and Affejee, 2023). Furthermore, scholars have outlined several perspectives, but no consensus has been established on the governance of AI (Fyfe, 2023; Katsanakis, Wang, and Affejee, 2023).
- Many institutions are developing guides or “AI Cookbooks” to train educators on how to use AI tools effectively. (How to Productively Address AI-Generated Text in Your Classroom, n.d.; The Ohio State University, n.d., Missouri & Florida, 2024). These guidebooks range from providing brief tips to entire lesson plans. An example is a writing center that developed a book of recommendations for faculty on adopting best practices for using AI tools (Yee et al., 2024). Recommendations include looking for hallucinations of citations and having clear AI writing policies in the syllabus (University of Central Florida, n.d.).
- Lie Gauges of Academia: AI Detectors
- The scholars conducted a practice with engineering GTAs to evaluate if essay data was AI-generated (Dugan et al., 2024). The research found that it is impossible to determine if an essay was AI-generated with AI detectors from

third-party vendors, such as Turnitin. The results of false positives have led to lawsuits involving the rescinding of scholarships (Hale, 2025). Reports show vendors and universities turned off their AI detector capabilities due to false positives (Pratschke, 2024). More studies indicate that AI detectors are biased against non-native writing students (Sadasivan et al., 2025).

- Researchers found that AI, such as the grammar tool Grammarly, is more likely to be flagged by AI detectors (Bordalejo et al., 2025). AI tools that replace and generate entire passages, such as Microsoft's CoPilot, went undetected. Faculty centers found that students can use AI tools to disguise their text with tools like QuillBot and WordAi (University of Central Florida, n.d.). Due to the unreliability of AI detectors, researchers recommend that academics mentor ethical AI practices instead of blanket policies (2025). A university published a statement discouraging faculty from using AI detectors due to biases and false positives (University of Iowa, n.d.).
- The Rebirth of Essays: Artificial Assessment
- Experts claim that academia can no longer use essays as assessments due to AI. (Marche, 2022). Others have refuted these claims, stating that higher education must evolve formative assessments (Rim, 2022). Researchers found AI tools helpful because they provide rapid feedback and enhance students' writing skills, improving their self-efficacy (Gardner et al., 2021; Mollick & Mollick, 2023). Educators find there are additional ways to assess students, such as using paper and pen alongside AI tools (National Foundation for Educational Research, 2024; Sharples, 2022).
- AI and Learning
- Researchers find that students using AI tools to solve tasks improve their self-efficacy (Schei et al., 2024). Research has found that AI tools have outpaced development times for intelligence tutoring systems (ITS) (Weitekamp et al., 2020). However, developing AI tools is costly and has left academia behind the private sector by wide margins (Lynch, 2024).
- Bias and Environmental Concerns
- Scholars find several implications of AI tools, as AI serves as both a practical tool and a source of controversy in an arms race, shaping our global markets (Huang, 2025). DeepSeek, a Chinese-developed AI, claims its product is better and cheaper than American products, which shocked the stock markets (2025). The rise of international AI raises privacy and national security concerns for the United States regarding data practices (2025).
- Researchers caution about humanity's ethics and fate with the emergence of AI tools (Roose, 2025). A report examines how AI's rapid evolution can pass complex assessments it failed to achieve a year earlier (Phan et al., 2025). The assessments indicate AI will outsmart the most sophisticated problems developed by humans. Advocates for AI reform argue that the rapid development of AI

poses risks, including the potential for rogue AIs that can cause harm (Hendrycks et al., 2023; Hoffman, 2023).

- Creatives and artists have felt the impact of deepfakes. Large companies like Meta have illegally scraped the internet to train their AI for the “Greater Good” (Udinmwun, 2025). Higher education institution, such as the University of Michigan, have developed their own AI to navigate the concerns of bias and copywriting (O’Connell, 2025).
- Advocates for AI emphasize that higher education professionals must be aware of the ethical issues surrounding AI (Schei et al., 2024). For instance, an AI researcher was prompted by an AI tool to commit suicide (Guo, 2025). Industry experts predict that AI will evolve rapidly alongside high-performing computers, such as quantum computers (Xie et al., 2023). The problems with AI feedback extend to bias and manipulation (Giray, 2024). Non-native speakers are more likely to be flagged as false positives by an AI detector. These biases can arise from students generating outputs and false positives from the AI detectors. Lastly, there is growing concern about the environmental problems of AI, including higher CO2 emissions from large data centers (Kanungo, 2023) and plans to adopt nuclear energy (Hjelmeland et al., 2025).
