Anna Bradley

My name is Anna Bradley, and I am a graduating senior at Avonworth High School. I researched the impact of generative AI on nursing in hospitals for a semester course and recently studied this administration's viewpoint on AI regulation. Based on my two months of student research I think AI should be advanced and utilized in a very cautious manner. The many benefits of using AI include, lessened documentation time, helpful resources, rewriting discharge papers, medicine prescriptions, and much more. However, I believe it should be a cautious tool instead of something relied upon. AI, although not fully developed, will never reach the expectations needed when it comes to health and medicine. Researchers have found an immense draw back when using AI tools like ChateGPT in nursing because it cannot adjust to many health issues at once. It takes longer routes to solve problems, advises expensive tests when not needed, and when put side by side in a competition with nurses, took much longer to find resolutions. I think AI can be a beneficial tool when used correctly. Acting as a nurse is not the proper way to incorporate it into health care. Instead, being an assistant in the technology aspects of the job. Documentation time takes up approximately 26.2-41% of the work hours specifically for nurses (Yen, Kellye, et al). Using AI could lower that percentage and allow more patient-nurse interactions. I truly believe using AI could open doors for healthcare to advance, however, it must be cautiously incorporated and utilized in the nursing field.
