I worked in the public sector, in law enforcement electronic communications, and in the private sector as an investigator specializing in TSCM (Technical Surveillance Counter Measures). As a military reservist, was involved with instruction and planning of radio communications. These technical fields made me very aware of the need to keep communications (and in the broader sense, the internet, computers, phones and apps) secure and safe from all adversaries and hostile entities. I strongly support the Development of an Artificial Intelligence Action Plan, but with a few caveats: (1) US national security, and US dominance must be first and foremost in all aspects of the AI plan. (2) There must be controls of "big tech". Remember the recent problems with US big tech (and foreign) influencers, blacklisting, cancel-culture, political interference and censorship? So, is not hard to imagine China (CCP) or other bad actors doing much more damage with hostile AI; hijacking our AI, or false-flag AI operations. Thank you.
