Ai needs to be regulated to protect personal information and digital property, prevent mining on personal devices/sites, theft of copyright work, and prevent reputation damage from fake images, videos, and documents. Ai being used to help with medicine and science, which is a great Ai to invest in but there still needs to be a knowledgeable human on the other side that can confirm the Ai's results. Not us just blinding accepting the computer's answer, when it could have been fed the wrong during its mining. We need laws protecting people and go after companies that create forged documents made by Ai, use image generators to make porn of real people, and protect jobs. Ai should be seen as a tool, not as a worker replacement. If an Ai gives customers incorrect answers, there should be someone on site to correct the information. If the Ai gives customers incorrect information that gets them injured or killed, there should be laws holding that company accountable for not properly testing their Ai and not checking the info they feed to the Ai
