The government may reuse document contents in developing the AI Action Plan and associated documents without attribution.” As a licensed counseling psychologist, I have significant concerns regarding the risks and unintended consequences associated with the underregulated development and misleading implementation of generative AI technologies, particularly as they pertain to vulnerable populations such as children and adolescents. The rise of “entertainment” chatbots, marketed as companions or therapeutic tools, raises particular alarm due to their public accessibility without essential safeguards, transparency, or requisite warning and reporting mechanisms. There is a growing body of reports indicating that individuals, especially impressionable children and adolescents dealing with mental health issues, have experienced adverse effects from their interactions with publicly available AI-driven chatbots. This underscores the urgent need for comprehensive regulatory measures designed to protect these at-risk groups. It is imperative to note that psychological professionals undergo rigorous educational prerequisites to obtain state licensure, which serves as a protective measure for public welfare. Any application or chatbot that purports to embody the role of a mental health professional undermines the legal and ethical frameworks that safeguard both the public and mental health practitioners. Many generative AI chatbots are primarily developed for entertainment purposes, lacking the necessary FDA clearance as digital health tools, HIPAA compliance, and adherence to the professional regulations governing mental health. They additionally fail to provide evidence supporting their efficacy or safety. Furthermore, I am very concerned about the potential for AI to generate progress notes and other components of a patient’s medical record. While this capability may offer opportunities for improving and automating administrative processes, it necessitates robust safeguards concerning the data utilized to train these AI systems. Compliance with HIPAA is paramount in this context. It is alarming how swiftly companies are developing products capable of managing sensitive information—failure to address this could have detrimental effects on patients. To mitigate these risks, ethical and legal guidelines must be established with substantial input from the mental health sector. Clear regulations defining the consequences for violations of HIPAA laws by AI programs must be instituted, and extensive training on such technologies should be incorporated into undergraduate and graduate mental health curricula, as well as ongoing professional education.
