A "plan of action" to ensure U.S. leadership and superiority in AI should include the following three points, among others: 1. Rescind the 15% indirect cost rate limit enacted by NIH on 2/7/2025 (and being considered by other funding agencies, such as NSF). This cut will cause universities to not even apply for government grants anymore, and is already encouraging private sponsors to request the same unworkable reduction. This will achieve the opposite of the government's goal by triggering a collapse of research efforts and a "brain drain" of AI researchers to China and Europe. While the indirect cost rates charged by some institutions may seem excessive, new rates could be negotiated based on audited facts about administrative and support costs, not on such an arbitrary low limit. 2. Identify and retain (or rehire) government employees whose job is related to leveraging AI in their various departments and agencies, for example (but not limited to) the Cybersecurity and Infrastructure Agency (CISA), where AI is used to detect and counter cyberthreats against critical national resources. Probationary government employees, who are currently being fired en masse, are often precisely the younger ones who have greater expertise in AI. "AI literacy" needs to be taken into account when making personnel decisions. 3. Abandon the political posturing: by including in the text of this RFI an unnecessary attack against the actions of the previous administration, you are probably discouraging a number of important actors from contributing to the desired plan of action.
