Generative Large Language models are an embarrassing garbage technology, peddled by deranged little conmen. While there are a few uses for this technology in some scientific fields, it is, for the most part, a hilariously costly bull%^&* machine that runs on a massive amount of theft. Even ignoring the damage it causes to the US power grid, the environmental and energy costs, the mountains of copyrighted material that is plagiarised, and the studies that show that constant use of this technology is harmful for people's critical thinking skills, there is yet to be any evidence that this technology can be sustainably profitable. Generative Large Language models are not scary or impressive, they're just trash that has been hyped up by marketers and a tech media that is far too credulous of companies that are obviously trying to scam society. I cannot stress enough that this technology does not have a sustainable future, Generative Large Language models require constant access of up to date human made data in order to occasionally hallucinate useful summaries, however the flood of generated hallucinations will devalue and economically choke out the humans who would create the very data that Large Language models require to function. I do not understand how so much of society is so completely enraptured by this very scam. The AI bubble is going to do a great deal of damage when it pops, and that damage will be even more serious if the US government is foolish enough to further invest in Large Language model technologies. I would very strongly ask the government to not only disinvest from this trash technology, but also to work to regulate it for its plagiarism and energy costs. Thanks.
