In my view the U.S. should build massive AI data centers for AI companies, These can be owned by the U.S. Government and leased to AI companies for a fee. This way the U.S. can recoup some or possible all of its cost. (potentially profiting from this and putting this money into a National sovereign wealth fund for the U.S.) AI Companies can help design these data centers to fit their needs in coordination with the Federal Government this would mean AI companies could spend less capital on building Data Centers and Power stations in the short term and focus and developing the actual AI. This would not only help the U.S. remain in the lead but would likely attract foreign investment into AI as well in the U.S. depending on the size of the investment for example 1-2 trillion over four years, it would be highly unlikely for China to catch up. controlling the servers would also make it easier for the U.S. to shut down rouge AI agents. my opinion is that the power stations powering the data centers should not be able to be controlled by an AI. It, would be better to shut down a rouge AI by going after the power center not the data servers. A few reasons for this is that, 1. its easier to go after the power stations instead of a data center is that the power station is smaller. 2.going after the power station instead of the data center is cheaper for rebuilding. 3. going after the power station means the data in the data servers is preserved and the government can go through the data to see what went wrong to prevent it from happening again.
