The AI Plan should include taking the Privacy Rights of American's into account ensuring the Federal Government does not use Americans data. The Plan should ensure AI models use a risk based approach to validate the models, this will help increase innovation of AI. AI models that are classified as high risk should have extra obligations to monitor, report, develop and deploy their AI. The plan should address and ban the use of data to build models that the data owners have not consented to be used in a data model. AI model testing should include bias testing ensuring that the AI model does not target or disadvantages individuals because of their beliefs or for any other reason. The plan should instruct the IP community including the US Patent and Trademark office to address data ownership for information produced by AI, who owns the output the user of the model owner. The plan should also encourage the implementation of AI into the US education environment to prepare American youth to use AI. Current education models discourage the use of AI and if American wants to become an AI leader this needs to change. The plan should include a transparency requirement and ensure they are not just taking jobs from hard working Americans but ensuring if they are there is a transition plan for those hard working Americans. Some types of AI should be banned that would turn the US into China. Such as manipulative AI and social scoring systems. AI should have rules in place on which countries can hold Americas AI systems. Overall the plan should focus on protecting Americans while ensuring to bring America to the forefront of AI innovation. If there is not a good enough plan in place then companies may have a poor framework on their development of AI and though we may have a lot of AI on our market we could close ourselves off from selling our AI to the rest of the world. We want America to be a leader in AI and we don't want the lead in AI requirements to be in other nations or be run by states. If the federal government wants to take the lead on AI the plan, guidance and rules need to be better than what current US states have and better than what other nations have. If ours is not better then any plan, guidance, law or executive order we put in place will be meaningless.
