As an engineering student and I've been following the path for the last 6 years on Artificial Intelligence. In the United States AI Action Plan, should be clear steps to get us ahead in the energy race, and as fast as possible. China is building a heavy energy industry already and fast. "The Chinese government has implemented comprehensive policies to bolster AI development. The "Next Generation Artificial Intelligence Development Plan," issued in 2017, outlines China's ambition to become a global leader in AI by 2030. This plan emphasizes the integration of AI across various sectors, including smart manufacturing, quantum computing, biotechnology, and space exploration, demonstrating a commitment to technological sovereignty and economic resilience." Another point of reference is the according: Between 2013 and 2021, China invested approximately \$679 billion in infrastructure projects across transportation, energy, and other sectors, significantly surpassing the U.S. investment of \$76 billion in the same areas." We need to scale up as quickly as possible, it could either end up with them being so far ahead in the AGI race or Us, and who knows what that could mean for areas including cyber, militarily, for technology like quantum and encryption, and all of the sorts. China has no trouble already illicitly poking at our cyber infrastructure and companies in the tech sector. China is already moving rapidly and at this point we should be too.
