AI work is required to further develop. AI is very helpful for our daily work and life. Many users even really like Deep Seek made from China with better accuracy and function. Supporting AI research is the right direction. not only for developing high stake scientific areas with AI, but also, basic clinical research (e.g, AI/ML algorithms for clinical decision supportive system to predict cancer treatment toxicity to identify high risk groups of chemotherapy side effects) for everyone can easily utilize this in the clinical practice.... is very important to further be supported by the NIH future fund. This has been very ignored for a long time compare to many fundings to support AI application to help DEI. (e.g., applying AI to identify high risk of dementia patients - in the socially vulnerable and underserved community area etc.). Applying AI for really helping patients are very important ! Thank you
