

Anote - AI Action Plan

Submitted to: NSF

Response Title: Anote - AI Action Plan

Date: March 14th, 2025

Name: Natan Vidra

Role: Founder / CEO

Company Name: Anote

UEI: FV9GVYUPCHJ8

CAGE Code: 9ZYX7

Location: 160 West 66th Street, Apartment 59B, New York, NY 10023

NAICS Code: 541715, 541511

Type of Business: We are a Small Business under NAICS Codes, Non-Traditional

Number of Employees: 10

Phone Number: 551 - 795 - 6549

Email Address: [REDACTED]

Developing an AI Action Plan

This document is approved for public dissemination. The document contains no business-proprietary or confidential information. Document contents may be reused by the government in developing the AI Action Plan and associated documents without attribution.

Introduction

AI has been advancing rapidly, and is progressing at an exponential pace with models and innovations such as GPT, SORA, Gemini, Claude and AlphaFold all coming out every few months. Despite this, most people in America are strangers to this AI technology, and haven't used ChatGPT or any AI technology. For America to stay ahead in the AI race, we need to focus on helping train and develop our AI workforce, and prevent American people from falling behind.

From a global perspective, America is directly competing with China in the AI race. America has many incredible AI companies such as OpenAI's GPT, xAI's Grok and Anthropic's Claude. China has recently made a lot of progress with models such as Alibaba's Qwen, Deepseek's R1 and Manus' General AI Agent. While America is still ahead in the AI race, there is significant risk of our lead diminishing over time. One cause is the data, where China has access to larger quantities of data to help train powerful machine learning models.

Today there is a data gap between the models being used to train LLMs like Anthropic's Claude and OpenAI's GPT, and the amount of privately held data within the US government and various agencies within the DOD. As a result, the performance of AI models for many defense related use cases is quite limited. To account for this:

Recommendation 1: Different governmental agencies should leverage their own data to train and fine-tune domain-specific large language models for government-related use cases.

To effectively do this, the government will need to aggregate, label and convert its own structured and unstructured data into a format that can be used to train powerful models, and then customize the models to be specific for a variety of use cases. There should be clear evaluation metrics for each of these use cases, and the ability to measure a variety of models on these evaluation metrics. From a technical infrastructure perspective, Anote has provided a lot of guidance on best practices for this, and we have open sourced our [human centered AI methodology and code](#), [documentation](#) and [research](#) for details here.

Another pressing cause of this risk to losing the AI war is related to workforce development. Many people within America still do not know much about artificial intelligence, so despite the tremendous progress of AI technology, many people are getting left behind. People within the workforce that know how to use AI are starting to replace those who don't know how to use AI. From a national perspective, within America our artificial intelligence technology brings a high likelihood of the automation of both white collar and blue collar jobs. There is a significant risk that 20 to 40% of jobs within America will be replaced in the next 5 to 10 years. Jobs such as data entry clerks, insurance underwriters, financial analysts and medical transcriptionists are at risk. While new job opportunities will arise from the advancement of AI, people within America need to learn how to use AI to be able to effectively do these new jobs.

We want to help people stay ahead of the AI curve and have a say on where this technology should be applied. We need to take immediate action to help members of AI communities around the USA learn about how to use AI in practice in their everyday lives. To combat this issue, we need to develop our workforce and train them with AI related skills.

There is a need for an AI Action Plan to help America stay ahead in the AI race, and to help US Citizens not be left behind from the AI technological revolution. As a culmination of thousands of interviews and hundreds of conversations with industry partners, our team developed an AI Action Plan for the United States, focused on AI education and workforce development. This document outlines our recommendations on AI education, workforce development and accessibility to help shape an inclusive national AI Action Plan.

AI Action Plan Overview

Our AI Action Plan focuses on workforce development, and consists of four critical components:

- 1. Aggregation and curation of AI related data:** This consists of hubs for:
 - a. AI job opportunities from industry partners
 - b. AI trainings and educational resources for learning
 - c. AI talent pool with interested community members
- 2. Distribution and dissemination of AI content:** This consists of hubs for:
 - a. AI related events and meetups
 - b. AI newsletter with up to date AI news
 - c. AI social media outreach (linkedin / youtube)
- 3. Collaborations and Partnerships between members:** This consists of hubs for:
 - a. AI related partnership opportunities on contracts
 - b. AI consortium of researchers and industry partners
 - c. AI data sharing of datasets, evaluation benchmarks, models and agents
- 4. Engagement to bring the AI community together:** This consists of hubs for:
 - a. AI slack / whatsapp community for centralized AI communications
 - b. AI open source projects that community members can contribute to
 - c. AI members portal to find other community members to connect with

This AI Action Plan should be implemented on a national level as well as a state / city (local) level, with different sub-communities with local resources for specific areas of interest. For each local sub-community, AI resource curation (news, events, venues, speakers, jobs, talent) should be specifically curated for that local community. We propose the name of this plan to be the Armor Institute, and to be an open project where all people can contribute.

Aggregation and curation of AI related data for Job Opportunities, Trainings and Talent Pool:

The proliferation of AI training initiatives – while positive – has led to a fragmented landscape. Multiple government agencies run programs that support AI workforce development, but these can operate in silos or lack a unified platform for stakeholders to navigate. There is a clear gap in aggregating information and matching supply with demand. For instance, a community college might develop an AI course, but local employers might not be aware of the talent pipeline being created; conversely, tech companies have training resources that educators or workforce boards might not easily find or incorporate. The absence of a central place for AI workforce opportunities diminishes the potential synergy among programs.

Recommendation 2: Create a centralized digital platform that aggregates AI workforce resources – a one-stop portal where individuals, job seekers, employers, and educators can find and share information on training programs, job openings, apprenticeships, mentorship opportunities, and events across the country.

As far as job opportunities, having a platform that would allow a user to see, for instance, all AI apprenticeship programs or entry-level AI job postings in one place, would be quite helpful. The platform should integrate with existing resources (like AI.gov or WorkforceGPS) and incorporate AI tools (e.g. personalized skill assessments and career navigation powered by AI). This also should contain high quality jobs by strong industry and enterprise partners, and can contain some of the AI related listings from AI job sources such as LinkedIn and Indeed as well. By aggregating job opportunities, this platform can help match talent to opportunities at scale.

We recommend classifying the opportunities as training programs for early stage career members, apprenticeship programs which will help place people in AI jobs, and mid-level / senior level training for upskilling. Based on the category of training and job opportunities, community members can be matched with the appropriate training and AI learning program for their current stage of development. The Department of Labor should streamline the registered apprenticeship process for AI and IT roles (simplifying standards and paperwork) to encourage small and mid-sized companies to host apprentices. Mid-career and senior workers whose jobs are changing due to AI could benefit from short courses or certificates, so a governmental AI learning and AI Training grant could reimburse workers for approved AI courses would be beneficial. In partnership with employers, such grants could be co-funded by companies that identify roles for which they want to retrain staff rather than resorting to layoffs.

As far as trainings, we would recommend including the following AI resources to help community members with different skill levels learn more about how to practically use AI:

Name	Website URL
MIT's Introduction to Deep Learning	https://introtodeeplearning.com/
Deep Learning AI	https://www.deeplearning.ai/
Hugging Face NLP course	https://huggingface.co/learn/nlp-course/en/chapter1/1
Introduction to Computer Science	https://pll.harvard.edu/course/cs50-introduction-computer-science
Mindstone	https://www.mindstone.com/
Inspirit AI	https://www.inspiritai.com/

As far as the talent pool, all talent should have access to specific job opportunities and training resources. Organizations such as Breakthrough Tech help provide AI training opportunities to a variety of college students, and organizations such as Inspirit AI are helpful for high school students looking to learn more about AI. Companies like Daimlas AI help curate local AI resources for each specific region, and non-profits like AI Blueprints is a great example of a local AI resource curation hub in Boston. We think that a central community ecosystem in the USA would be amazing, in an open model where people who want to learn can easily participate.

Distribution and dissemination of AI content with AI Events and an AI Newsletter

Even where AI training, job opportunities and programs exist, awareness and engagement can fall short. Many job seekers and current workers are not aware of the AI training opportunities available to them, or may not see AI skills as relevant to their career if they are outside the tech sector. Similarly, industry-led programs (like corporate online academies or certifications) sometimes struggle to attract the very populations most in need of upskilling (e.g., workers in industries being disrupted by AI). Thus, there is an engagement gap not only at the individual level, but at the employer level: many companies that could benefit from AI training programs (to retrain their employees or hire new AI talent) are not yet plugged into the ecosystem of workforce initiatives. This suggests a need for better outreach, user-friendly program design, and incentives to broaden participation.

Recommendation 3: Encourage community-driven initiatives such as AI events and AI newsletters to help engage the public in AI learning and career development.

AI may seem intimidating or irrelevant to many Americans; demystifying it requires meeting people where they are. We recommend hosting AI learning events – from introductory workshops to AI hackathons addressing local issues – to bring local communities together around learning more about practical AI applications. Digital platforms could promote these events widely, acting as a distributor of engagement opportunities so that a student in a small town can easily find a virtual AI meetup or a nearby community college seminar. Community colleges, given their integral role in local workforce development, should receive support to become hubs for AI engagement. We recommend the following companies for AI events:

Company	Company URL
Mindstone	https://www.mindstone.com/
AI Camp	https://www.aicamp.ai/
AI Tinkerers	https://aitinkerers.org/p/welcome
MLOps	https://mlops.community/

Community	
Gen AI Collective	https://www.genaicollective.ai/
Cerebral Valley	https://cerebralvalley.ai/

We propose a phased rollout to establish AI meetup chapters in new cities. In Phase 1, we suggest focusing on launching 3–5 new city meetups (for example, Boston, Washington D.C., and Chicago) where there is already substantial tech and academic presence to build upon. In Phase 2, we suggest expanding to additional cities such as Miami, Austin, and others across the South and West, including potentially West Coast locations. Below you can find some recommended cities to expand to in the USA, though we think this should also be largely accessible to more rural areas and inner cities where these hubs don’t currently exist:

City	State	Priority	Target Launch Date
New York	NY	Current Hub	Active
Toronto	CANADA	Current Hub	Active
Washington	DC	Phase 1	Q1 2025
Boston	MA	Phase 1	Q1 2025
Chicago	IL	Phase 2	Q1 2025
Miami	FL	Phase 2	Q2 2025
Atlanta	GA	Phase 2	Q2 2025
Austin	TX	Phase 2	Q2 2025
Los Angeles	CA	Phase 3	Q3 2025
San Diego	CA	Phase 3	Q3 2025
Seattle	WA	Phase 3	Q3 2025
Mountain View	CA	Phase 4	Q4 2025
San Francisco	CA	Phase 4	Q4 2025
Berkeley	CA	Phase 4	Q4 2025

This approach allows you to pilot the meetup model in a variety of settings and refine our playbook before nationwide expansion. For each new chapter, we recommend recruiting a local AI Community Lead responsible for on-the-ground organizing. Once initial meetups are successfully established and local momentum builds, we suggest chapters will operate on a

regular monthly schedule with oversight and coordination from Anote’s central team (to share resources, speaker opportunities, and lessons learned across cities). This systematic expansion plan will enable us to maintain quality and consistency as we grow, while also tailoring each city’s events to its local community interests.

Crucially, these community efforts should highlight inclusive participation. They should be marketed to underrepresented demographics – for example, AI training programs for women re-entering the workforce, AI literacy courses for older workers at community centers, and collaborations with organizations serving people with disabilities to ensure content is accessible. By infusing AI learning into the fabric of community life and online social learning, we normalize the idea that AI skills are for everyone, not a niche group.

To execute on this distribution method, we recommend an AI Newsletter such as Digestible AI to be disseminated to community members, with the purpose of breaking down complex AI topics into clear, actionable AI insights that are accessible to both technical and non-technical audiences. In addition, social media and online learning communities can be powerful. The government could facilitate the creation of an AI Community of Practice Platform – an online forum where learners, experts, and mentors interact, share projects, and answer questions.

Collaboration and AI Partnership Opportunities Between Community Members

Despite the multitude of programs underway, significant gaps exist in the current AI workforce development landscape. These gaps relate to who can access opportunities, where programs are deployed, how well efforts are coordinated, and alignment between training outcomes and industry needs. The way we propose solving this is via aggregating many AI resources, and then sharing these resources to help people engage at a large scale. Central to this plan involves collaborations and partnerships with a variety of different industry and community members.

Recommendation 4: Expand AI Partnerships with Incentives for Industry Collaborations. We propose sharing contract opportunities, and developing a consortium of industry members,

enterprises, universities and governmental agencies, where groups will collaborate on a variety of AI projects and initiatives:

While many companies are voluntarily investing in AI training, a formal public-private partnership program can align these efforts with national workforce goals. We recommend developing an AI consortium where different community members can meet each other and collaborate on a variety of publicly available opportunities. We recommend sharing these opportunities on a publicly accessible portal, where members can view them, meet each other and partner in the most optimal ways.

We suggest building a consortium of AI experts and stakeholders from institutes and companies across America. The goal of this consortium would be to unite academia, industry, and the tech community in a shared mission: developing the workforce's AI skills through real-world projects and knowledge-sharing forums. By bringing together AI researchers, practitioners, and enthusiasts under one umbrella, we can ensure that American people and companies benefit from the latest AI breakthroughs and industry best practices. Our team has created such a consortium, with a variety of industry partners and research organizations, to help build local AI hubs and collaborate on AI project initiatives across America.

AI Sharing of Evaluation Datasets, Models and AI Agents

Bringing industry partners, researchers from universities, and members of the talent pool together is the first step. However, there needs to be alignment on the datasets, models and

tasks that community members will collaborate on. To improve alignment between education and industry needs, the government should champion the development of open standards for AI related projects, that way everyone can be aware of ways to contribute.

Recommendation 5: Foster Data Sharing and Alignment through Open Standards, by developing open source datasets, models, agents and projects where anyone can contribute:

When it comes to evaluation datasets for benchmarks, industry standard models, and AI agents, there should be open hubs where members of AI related communities in the USA can share these resources in an open way to benefit fellow AI researchers. On the evaluation datasets and benchmarks point, there could be a hub where people would share specific testing datasets (filterable by task types). For each of these testing datasets, community members can submit AI models to see how each industry standard model compares on that testing dataset. Our company, Anote, has developed a model leaderboard for this capability, where community members can share how models like GPT, Claude, Mistral, Llama and Grok compare on a variety of benchmarks - we can help build an analogous portal but for certified AI models and evaluation benchmarks pertinent for government use cases.

The image shows a screenshot of a benchmark test datasets interface on the left and two model leaderboards on the right. The interface includes tabs for Classification, Chatbot, NER, Prompting, and AI. Below these are icons for various benchmarks: Bizbench, Financebench, Emotion, Finance, MedQuAD, PubMed, QuoraQuAD, and RagInstruct. The leaderboards show rankings for models like GPT-4, Llama, and Mistral across different tasks.

Task Type	Benchmark
Classification	Bizbench, Financebench, Emotion, Finance, MedQuAD, PubMed, QuoraQuAD, RagInstruct

Rank	Model	Score	Last Updated
1	GPT-4-Turbo-Instruct	0.83	Oct-2024
2	Mistral-Llama-3.1-70B-Instruct	0.819	Oct-2024
3	Mistral-Llama-3.1-70B-Instruct	0.813	Oct-2024
4	Gemma-2-27B-4	0.788	Oct-2024
5	Phi-3.5-MoE-Instruct	0.785	Oct-2024
6	Phi-3-medium-4k-Instruct	0.781	Oct-2024
7	Mistral-8x22B-Instruct-v0.1	0.762	Oct-2024

Rank	Model	Score	Last Updated
1	GPT-4-Turbo-Instruct	0.743	Oct-2024
2	Mistral-Llama-3.1-70B-Instruct	0.714	Oct-2024
3	Mistral-Llama-3.1-70B-Instruct	0.692	Oct-2024
4	Phi-3.5-MoE-Instruct	0.67	Oct-2024
5	Phi-3-medium-4k-Instruct	0.666	Oct-2024
6	Mistral-8x22B-Instruct-v0.1	0.653	Oct-2024
7	Gemma-2-27B-4	0.636	Oct-2024

On the point of AI agents, one key problem is that while AI agents are becoming more and more ubiquitous, it is difficult to productionalize AI agents, and it is hard to find and share the agents that have been created. We recommend creating an analogous AI agent hub, where agents that are particularly helpful for important defense use cases can be shared with other members of the USA AI community. Our team at Anote has actually already developed a hub for agents for traditional commercial use cases (email marketing, AI assisted coding, financial analysis, etc.), and would be happy to help expand this to aid with American interests.

We also believe that community members should be encouraged to collaborate on open sourced AI initiatives, so long as they benefit American interests. We recommend organizations such as the Linux Foundation, who have built incredible communities of developers to help augment existing AI projects. Our team at Anote has released two open source projects – the first on [our MLOps Platform](#) for labeling data, training models, making predictions and evaluating the results of LLMs, and the second on an [AI agent platform](#) for collaborative, intelligent autonomous multi agent AI systems.

We invite members to contribute to these projects, and think that it would be nice if community members could meet each other via centralized communications. Perhaps there should be a slack / whatsapp community, or an AI members portal to find other community members to connect with. Regardless, to successfully foster data sharing and openness, figuring out a way to connect people and have them engage in a collaborative capacity is a prerequisite.

For Anote, we have figured out a way to engage a vibrant AI community in the USA. Our Slack community has grown to over 1,000 dedicated members who actively exchange ideas, collaborate on projects, and support one another's growth. Additionally, our partner Mindstone connects more than 13,000 members, creating a dynamic ecosystem where expertise and innovation meet. We hosted an AI Day Summit 2025, a landmark event that brought together over 50 speakers and attracted thousands of attendees from across the country. The summit showcased a diverse range of topics—from AI research to real-world applications. With all [talks recorded and posted online](#), the wealth of knowledge shared during the event remains accessible to anyone interested in the future of AI.

Conclusion

In conclusion, Anote strongly supports the NSF's efforts to develop a comprehensive AI Action Plan that ensures no American is left behind in the age of AI. Our recommendations focus on empowering people through education and community-building, which we believe are fundamental to bridging the gap between rapid AI advancements and the public's ability to understand and leverage these tools. By scaling up initiatives like AI meetups, workshops, and

collaborative projects – and by providing the necessary support and partnerships – we can foster an inclusive AI ecosystem where innovation is democratized. With strategic support, what we have accomplished can be expanded nationwide, cultivating a generation of AI-literate citizens and a workforce ready to drive AI-enabled growth in every sector. Anote is committed to this mission of accessible AI for all, and we stand ready to collaborate with policymakers, industry, and academia to implement the vision outlined in this response. Together, we can shape an AI future that is inclusive, empowering, and beneficial to society as a whole.
