I am writing to strongly urge the inclusion of policies related to environmental protection in any national action plan for artificial intelligence. Continued U.S. leadership in the development of AI is critical for shaping the future digital landscape, as these technologies carry immense benefits for the American people. However, in advancing the development of AI, we must also be cognizant of the negative environmental impacts of such development.

The training and use of AI has come with corresponding increases in electricity demand, water consumption, and harmful gas emissions. This is particularly true with the introduction of more powerful generative AI models, which have seen rapid development and deployment in recent years. By all projections, the explosive growth of this emerging technology will only continue in the near future.

As such, it is essential that the United States take the environment into account. It is the duty of the federal government to protect American land, air, and water for future generations, a feat that is more necessary than ever. Combined with the growing impacts of climate change nationwide - which include more frequent and severe weather events that affect human health and safety as well as changing weather patterns that reduce agricultural productivity - the uncontrolled growth of artificial intelligence technologies is poised to do severe harm to the nation.

Mitigation of the massive environmental impacts of artificial intelligence is possible. Both private and federal researchers have already launched efforts to study these impacts. With prudent federal policies that prioritize sustainable AI development, the U.S. can preserve national natural resources while enhancing innovation and technological dominance. For this reason, I again urge you to support the responsible and sustainable development of AI technologies. Thank you.
