The companies providing AI computation should be required to pay for the many secondary costs of this technology, i.e. extreme energy consumption and environmental fallout. The consequences of unscrupulous expansion must be accounted for and prevented, which can only happen by reigning in heedless actors. There must be extensive work done on responsible use of the technology, including via public education campaigns, in laws preemptively safeguarding Americans from outsourced decision-making left to flawed algorithms. “A computer cannot be held accountable; therefore a computer must never make management decisions“ should be a well-known and enforced standard before more lives, industries, and economies are forced to suffer for corporate use of AI.
