As someone who has been hameavuly interested in AI since it's debut, I think that AI will be a technological revolution that changes the world. The real changes this technology will make will likely happen in the background. I have already read many articles and believe that new AI has already made significant strides to bolster our economy, specifically in medical screenings and shipping & manufacturing tables. The technology used there will no doubt be a boon for our society, yet I worry about the more public facing aspects of this revolution. AI like ChatGPT have relentlessly cannibalized copyrighted content, and many businesses have c-suite executives looking to use this technology to replace real artists. Not only would this put many workers out of a job, but the lackluster quality of AI's creative output would be devastating to America's global entertainment industry. Failing to protect our own global entertainment industry would allow foreign powers to permanently replace us, and we would lose one of our nation's biggest exports. I also worry about the spread of misinformation already perpetuated by this technology, and worry that this issue could only grow if the U.S invests in AI without the proper caution. Beyond these problems, it is undeniable that AI will change the world, but the revolution this technology will bring is much closer to that of Microsoft Excel than the smartphone. When the U.S does (and I'm sure it will) promote the advancement of AI, I urge it to do so with a focus on industrial and medical uses. Protecting copyright will not harm these advancements, as the AI developed for these sectors is made in-house.
