I would like to submit my comment on a potential AI Action Plan as a private citizen and party directly impacted by the use of AI in creative fields.

I firmly believe that a large investment in AI, *specifically* in regards to AI's free access to both copyrighted and public material available online and elsewhere, is overall detrimental to the American workforce and people. I can only comment from the perspective of an individual whose employment does not use AI in their workflow, but sees AI usage everyday. With regards to the line "With the right governmental policies, continued U.S. AI leadership will promote human flourishing, economic competitiveness, and national security":

1. Promotion of human flourishing - I most commonly see AI in my daily life within applications such as Chat GPT and google search, as well as AI made art and writing within media such as film and advertisements. This is arguably the most common way the average American sees AI being used. These usages outright discourage critical thinking, meaningful searches for knowledge, and creativity, but more importantly put humans at risk of losing their jobs and right to their work. I am aware that OpenAI have been sued by newspapers and writers for the unfair data scraping of their published works. Creatives are being cast aside by potential employers in favor of AI tools that were egregiously trained on the writing and art of others. This has been seen in comic covers, film, even Youtube videos. This is not letting humans flourish, this puts human workers at risk in favor of AI-made work with none of the nuance, skills, and professionalism of a human being.

2. Economic competitiveness - I understand that the rest of the world is investing in AI at an astonishing rate, but like I stated above, I believe that this ultimately puts human workforces at risk. A few select companies and individuals may have better profit margins by using AI, but this would come at the expense of thousands if not tens of thousands of jobs across many fields. The creation of jobs within the energy sector would not account for the fact that workers across creative fields, education industries, medical fields, and more would lose theirs. Again, I believe AI-made work does not and cannot have the naunce of work made by a skilled professional. I would not want AI to be used to educate our children nor be used in such an important field as medical research.

3. National security - The usage of private data by private companies is already a huge concern, and excarbated by AI. AI has already encroached on public online information and copyrighted creative work, continued unrestricted access should not be encouraged.

Thank you for the opportunity to comment on this issue. As a private citizen, I'm only concerned by the direction AI is taking, and hope there can be more protections for the individual rather than the companies that profit from unfettered data and AI usage.
