Re: Request for Information on the Development of an Artificial Intelligence Action Plan

The next few years will be a defining period for future development of AI. The actions this administration takes in this time period will have lasting effects. I have conducted a literature review on regulation on AI. I am deeply interested in the future of the field, and I strongly support action taken to further development of AI while minimizing risks. Below, I offer some thoughts (based on review of current research as well as the recent EU AI Act) regarding what I consider to be most important in future policy developments.

Clarity of Regulations

The Office of Science and Technology Policy has shared concerns that poorly designed regulations may hamper the private sector's ability to innovate in AI. I agree that terms which are too broad and rely on interpretation will likely not help, or even hinder, innovation.¹ I believe that future regulation should implement measurable safety standards and clearly define the responsibilities of AI companies, deployers, and end users.

Transparency and Public Awareness

AI will only become more capable and ubiquitous in the future, and are already widely used for processing job applications,² for example. Often, many are unaware of the extent to which AI is used. I believe that people should have the right to know whether tasks are being performed by an AI or a human, so that they are able to make informed decisions accordingly.

Monitoring

The field of AI develops rapidly, with new breakthroughs often rendering previous work obsolete. I believe that it would be beneficial to establish a new agency responsible for carefully monitoring and evaluating new developments in AI, in order to respond to them effectively.

Sincerely,
Christopher Bao
