Dale Oakes

The following three overarching objectives are offered for consideration as the National Artificial Intelligence (AI) Action Plan is developed:

- o Any AI application that is developed by and used internally by the U.S. government must be totally secure. Entities outside the U.S. government must not be able to successfully attack or penetrate government AI applications. Physical security of U.S. AI applications inside the U.S. government must be designed to prevent compromise from within the U.S. government as well. U.S. AI systems must also have an offensive capability, to attack and punish those outside entities who attempt to attack or penetrate U.S. government AI applications.
- o Ensure that U.S. private enterprises are required to make their AI applications totally secure to prevent theft or an attack from other entities, especially foreign governments. The U.S. government should provide assistance to private enterprise AI developers to achieve the security necessary.
- o When developing a U.S. government AI application, a sustained “focus” on the AI objectives is critical. System designers and programmers are intelligent people with a dynamic skill set. However, it takes a dedicated effort to maintain focus on the AI objectives so the effort doesn’t get off track by developing system capabilities that are technically flashy and possible, but are not the best answer for the AI objective at hand. Some one or small group needs to be dedicated to maintaining focus.
- o I hope this helps a little.
