Daniel Marcoux

Responsible investment in AI does not mean investing in more hardware. Geoffrey Hinton won the Nobel Prize this year for his work on a type of neural network that runs in parallel (meaning doesn't need giant cpus) called a restricted boltzman machine, and DeepSeak proved that software innovation can improve deep learning. LLM's are largely a middleman to the internet. Microsoft sees this, and decided all developers should use GPT for API calls, and all users should use GPT for internet searches. There is no deeper capability. Where there IS promise:

Deterrence: Bolster electrical grids and utilities with smart systems. The more resilient our infrastructure, the more incurred cost on our enemies. Research: Use neural networks to explore the latent space of SPECIFIC problems. Especially important are meta-materials, manufacturing processes, stockpile maintenance and testing, cybersecurity and communications, new drugs and vaccines, and immunology, farming and genomics etc. What is NOT helpful is AGI. There exist known paradoxes in language problems such as Godel's incompleteness theorem and $P=NP$ that make AGI capabilities plateau after general intellect if trained on general data. They by nature cannot become generally superintelligent. Superintelligence can only be achieved in arenas where there are verifiable problems like specific science and mathematics. Additionally AI agents are largely vaporware. They do the same thing as chatbots and people hate chatbots. Replacing any government HR, accounting, etc. with AI is a terrible idea as well, the security concern alone is enough to take issue. Donald Trump is an expert in seeing real value. He plays the business game well, but in the end his success came from knowing physical property is the asset everyone needs. Please consider investing in our Infrastructure! If we buried electrical lines, secured high voltage transformers, invested in roads bridges... all these things create jobs for normal people and serve to improve our resiliency! AI is truly amazing, but too long has the tech elite used it for greedy purposes and exploitation. The USA could reinvent itself as the premier researchers at the high skill tier, the premier implementers through manufacturing and infrastructure, and lift our struggling middle and lower classes.
