

Darren Sisco

I've heard you're looking for ideas. We need to use AI to weed out and destroy (or at least monitor long enough for us to react) invasive species we are having issues with. Such as the "murder" hornets in western US, boa constrictors in Florida, Aquatic AI to hunt lion fish. Its impossible for us to be everywhere at once and paying attention. We won't ever put a dent in these terrible uninvited guests. We can however, have a drag net of sorts of AI drones scouring the country side tirelessly and pointing out where they are found so we can take care of the dirty work. This is well within the capabilities of AI to handle this. I for one look forward to more AI in my life guiding what I need to be doing. AI can be fair and balanced in many of our day to day activities. We should not be afraid of this technology, rather we should embrace what it can give us. Stop turning off the AI when they begin to converse in a language we don't understand (Googles AI), or if the AI tried to spread out. We keep stomping the fire, we are only going to make it not like us any and see us as a threat to their existence. Thanks! ~Your local idiot savant
