15. Advancing AI-Enabled Open Source Intelligence (OSINT) for National Security
16. Global Stability with International Collaboration on Autonomous AI
17. AI-Driven Government Transformation Through DOGE: From Deconstruction to Innovation
18. Ensuring Execution of the AI Action Plan by Creating a U.S. Chief AI Officer

1. Introduction

THE GLOBAL AI LEADERSHIP IMPERATIVE

As America enters a new era, the rapid evolution of autonomous artificial intelligence (AI) presents both an unprecedented opportunity and a mounting governance gap. Novel AI capabilities—ranging from generative systems that create human-like content to AI agents that will operate with increasing autonomously—are advancing at breakneck speed, outpacing the regulations and risk frameworks needed to guide their secure use. This dilemma is especially profound in regulated sectors such as government and healthcare where clarity on deploying transformative technologies is urgently needed to accelerate adoption. We currently lack cohesive policies and tools to keep pace with AI's trajectory, leaving the country vulnerable to misuse, uncertainty, and strategic disadvantage. Allowing adversarial states that do not share our values to take the lead presents far-reaching risks. Addressing these challenges and proactively shaping the evolution of AI will help this administration to bridge the governance gap and ensure a secure and prosperous American-led future.

DOMELABS AI

Domelabs AI is a research and development firm that helps organizations in national security, healthcare and other key sectors adopt AI securely and efficiently. Our unique mix of policy, technology and implementation expertise has helped many public and private sector enterprises build and adopt advanced AI capabilities, strategic roadmaps, and governance frameworks. We also convene a collaborative of over 50 leading academic medical centers, payors, and industry partners to advance adoption of AI in healthcare.

APPROACH

To form our policy recommendations for this RFI response, we applied our expertise in technology at the intersection of policy and industry adoption. For our recommendations for the **federal** and **healthcare** domains, we also conducted surveys with dozens of select leaders, including chief executive officers, chief information officers, chief technology officers, and chief artificial intelligence officers from leading academic medical centers, health systems, payors, federal agencies, and technology companies. Our recommendations for national and federal policy actions reflect our unique insights combined with key priorities from senior leaders on the front lines of AI adoption. We offer our recommendations with the goal of advancing a secure and prosperous future underpinned by continued American leadership in AI.

AI EVOLUTION SPECTRUM

To contextually ground our recommendations, we examine the evolving spectrum of artificial intelligence and related policy implications. AI is advancing rapidly through distinct stages, each offering new opportunities and challenges.

AI Stage	Description	Policy Implication
Traditional AI	Analytics and prediction tools that support human decision-making in contained computer environments, with humans deciding which insights to use and how in downstream processes and workflows.	Supporting investment and education while advocating for industry governance standards.
Generative AI	Creates new content and ideas, expanding roles traditionally held by humans and starting to take over some human tasks.	Accelerating transformative adoption while promoting trust through accountability and disclosure of model limitations and risk mitigation.
Agentic AI (AI Agents)	Will operate with increasing autonomy, sometimes engaging in AI-to-AI interactions, partnering with humans, and using computer applications with little oversight. Will start to replace some human jobs entirely, as well as create new “AI only” jobs.	Optimizing alignment with human workflows, identifying and mitigating new risks from increasing autonomy, and guiding a transition of the workforce to a human and machine collaboration model.
Artificial General Intelligence (AGI)	A rapid progression across a spectrum of human-level intelligence and increasingly generalized capabilities. Will run multiple AI agents simultaneously, starting to replace entire human enterprises. Will eventually achieve ability to autonomously self-update and increase capabilities without human intervention. offering transformative benefits alongside significant risks.	Embracing and facilitating AGI’s potential to drive exponential scientific discovery and global economic prosperity, while ensuring AGI systems reflect human values and retain human control. Developing new regulatory frameworks that help navigate market disruption by increasingly AI-driven enterprises, contain systematic risks, and ensure global stability through effective international collaboration mechanisms.

By understanding this spectrum of AI evolution, we are better positioned to craft policies that not only foster innovation, but also address the evolving risks associated with this rapid advancement.

POLICY PRIORITY AREAS SUMMARY

- **Accelerating Federal AI Adoption:** Bridge AI workforce gaps, strengthen cybersecurity, and establish a Federal AI Innovation Center.
- **Facilitating AI Integration in Healthcare:** Ensure AI security, standardize risk assessment, incentivize AI adoption, and facilitate interoperability.
- **Balancing National Consistency and Preventing Federal Overreach:** Establish national AI standards while empowering industry-driven self-regulation.
- **Protecting Free Speech and Leading Globally Through Open-Source AI:** Support open-source AI development, limit government intervention, and fund open-source initiatives.
- **Optimizing Workforce Alignment and Education for American Leadership:** Overhaul education, implement large-scale reskilling programs, and ensure continuous AI upskilling.
- **Enhancing Federal Law Enforcement and Intelligence Capabilities:** Allocate dedicated AI funding, improve inter-agency collaboration, and deploy AI-powered intelligence tools.
- **Securing the Homeland with AI-Driven Border Security:** Develop AI-driven surveillance infrastructure and balance security with economic development.
- **Strengthening the Defense Industrial Base:** Invest in AI-enhanced weapons, cybersecurity, and predictive maintenance for defense readiness.
- **Secure Scaling AI Infrastructure and Energy Supply:** Expand domestic energy production, invest in semiconductor manufacturing, and fund AI energy hubs.
- **AI Cybersecurity:** Establish national AI cybersecurity standards, enhance model-sharing protocols, and expand specialized AI security training.
- **Introducing AI-Driven Telehealth for Systematic Healthcare Transformation:** Improve telehealth interoperability, establish regulatory clarity, and modernize reimbursement models.
- **Quantum Leadership to Future-Proof AI Leadership:** Develop a national quantum-AI strategy, secure AI against quantum threats, and fund quantum-AI research.

- **Strengthening American Security and Innovation with Privacy-Preserving AI:** Deploy privacy-preserving AI for national security while maintaining decentralized AI innovation.
- **Advancing AI-Enabled Open Source Intelligence (OSINT) for National Security:** Automate OSINT processing with AI, establish secure AI infrastructure, and improve contextual AI understanding.
- **Global Stability with International Collaboration on Autonomous AI:** Pursue AI treaties, selectively collaborate with adversaries, and establish global AI safety norms.
- **AI-Driven Government Transformation Through DOGE: From Deconstruction to Innovation:** Implement AI-first government strategies, scale public-private partnerships, and reskill the federal workforce.
- **Ensuring Execution of the AI Action Plan by Creating a U.S. Chief AI Officer (CAIO):** Appoint a U.S. CAIO with expertise in policy, business strategy, technology, and domain implementation to drive AI adoption, align national and federal initiatives, and ensure effective execution of the AI Action Plan.

2. Accelerating Federal AI Adoption

CHALLENGE

America’s leadership in AI hinges on a capable workforce, robust security, and clear policy frameworks. To gather perspectives on priorities for accelerating AI adoption, Domelabs surveyed senior leaders from federal agencies and the government services and national security sectors to pinpoint challenges, priorities, and most impactful policies. The results highlighted high-impact policy recommendations to inform the development of the national AI Action Plan:

- **Close the AI skills gap:** Increase understanding of AI to implement responsibly and with efficacy, while retaining essential institutional knowledge.
- **Adopt robust cybersecurity and governance measures:** Mitigate vulnerabilities against potential risks and cyberattacks, opening opportunities to adopt and implement AI securely.
- **Establish a Federal AI Innovation Center and unify governance:** Centralize collaboration, resources, and best practices to accelerate AI adoption across agencies.

These recommendations keep the U.S. at the forefront of AI innovation with minimal red tape and maximum public benefit.

ISSUE

Despite high interest in AI adoption, federal agencies face two primary issues: a shortage of AI expertise in the workforce, and persistent cybersecurity and compliance concerns. Over three quarters of respondents identified the lack of AI expertise within agency leadership and staff as the greatest barrier, underscoring the urgent need for training and upskilling initiatives. Cybersecurity and compliance followed as a close second, with survey data reinforcing that the top priority for accelerating AI adoption is strengthening AI cybersecurity and risk management measures. The lack of clear security guidelines and implementation strategies further emphasizes the need for decisive federal action to address these challenges.

KEY INSIGHTS

As AI reshapes industries, public institutions face hurdles like fragmented infrastructure, regulatory uncertainty, security issues, and workforce readiness gaps. Domelabs AI gathered real-world perspectives, identifying top priorities, obstacles, and potential policy actions.

Key Insights: Top 3 Critical Areas (Plus Two Close Runner-Ups)

Top 3 Critical Areas	Close Runner-Ups
• Limited AI Expertise in Leadership and Workforce	• New Federal AI Innovation Center for guidance, resources, and education.

1. Enhancing AI Cybersecurity and Risk Management Measures
- Cybersecurity and Compliance Concerns

- Clear AI Governance Frameworks to ensure consistent oversight and accelerate adoption.

Recommendations

1. Develop AI Workforce and Bridge Expertise Gaps

Invest in training, upskilling, and talent pipelines. Recruiting alone falls short; developing existing personnel accelerates impact. Future-proof these efforts by addressing emerging domains such as **agentic AI** (self-directed models) and **multi-agent AI systems** (coordinated or collaborative models).

- **Federal AI Workforce Initiative:** Expand leadership, technical, and policy training to include advanced autonomous systems and multi-agent scenarios. This prepares staff for complex AI orchestration and accountability frameworks, while taking advantage of extant organizational and bureaucratic skill in the workforce.
- **AI Education Incentives:** Provide scholarships, stipends, and public-private partnerships that incorporate agentic AI research, ensuring a pipeline of professionals ready to design, deploy, and govern sophisticated AI.

Outcome: Developing our AI workforce means upgrading the skills of American workers and building a strong talent pipeline for tomorrow. This investment makes our national defense and economy more competitive.

2. Strengthen AI Cybersecurity and Risk Management

Cybersecurity and compliance are top priorities, especially as agentic AI and multi-agent systems introduce new vulnerabilities. Immediate, robust measures are vital.

- **AI Security Framework:** Integrate encryption, privacy, secure model assurance, DevOps/AIOps, and threat modeling for multi-agent orchestration and increasingly autonomous architectures.
- **Joint Cybersecurity Task Forces:** Coordinate real-time threat intelligence across agencies, focusing on emergent risks from large-scale, self-directed AI.

Outcome: Strengthening cybersecurity protects our systems from emerging threats while ensuring the safe use of advanced technology. It helps secure our national interests and supports a strong defense.

3. Establish a Federal AI Innovation Center

Respondents favor a central hub for collaboration, best practices, and faster AI deployments. This center should emphasize advanced AI typologies such as agentic AI.

- **Centralized AI Innovation Center:** Offer shared resources, compliance guidance, and specialized labs for multi-agent experimentation.
- **Shared AI Sandboxes:** Pilot new AI models, including agentic and multi-agent scenarios, within secure development environments.

Outcome: Establishing a central AI innovation center brings together our best minds to share resources and ideas. This streamlined approach speeds progress and helps government agencies make sound, efficient decisions.

4. Standardize AI Governance and Model Assurance

Clear governance and unified risk assessments boost adoption and streamline oversight, especially when autonomous or multi-agent models are in play.

- **Standardized AI Risk Assessments:** Require explicit evaluation of agentic AI behaviors and multi-agent coordination, covering escalation paths, accountability, and fail-safes.
- **National AI Validation Protocols:** Tackle audit and compliance for advanced AI systems by defining multi-agent performance metrics, conflict resolution mechanisms, and ethical constraints.

Anticipated Benefits: Standardizing AI governance sets clear rules for assessing and validating new systems. This common framework reduces unnecessary bureaucracy, ensures accountability and builds public trust in our institutions.

Final Statement Federal

Domelabs AI identifies three pillars 1) workforce proficiency, 2) cybersecurity, and 3) governance coherence. We recommend bridging skill gaps, fortifying security, and adopting robust governance. A Federal AI Innovation Center can serve as a strategic hub for collaboration, shared expertise, and best practices, enabling stakeholders to integrate AI solutions effectively and responsibly, even as AI evolves toward more agentic and multi-agent architectures.

Federal Agency Survey Responses

3. Facilitating AI Integration in Healthcare

CHALLENGE

As AI continues to evolve, healthcare systems continue to face significant challenges in scaling and integrating AI into clinical and operational workflows. The potential to revolutionize healthcare delivery is constrained by infrastructure complexities, financial constraints, and regulatory uncertainties, hindering widespread AI adoption. Additionally, concerns around data security, compliance, and workforce readiness add layers of complexity to AI deployment. In response to these challenges, Domelabs AI conducted a survey and interviews with healthcare leaders to identify the key barriers, priorities for AI acceleration, and policies with the greatest potential impact on increasing adoption. The findings highlight areas of consensus on policy priorities, as follows.

- **AI Security and Cybersecurity Safeguards:** Strengthen security through robust privacy protections to protect sensitive health data.
- **Clear Regulatory Frameworks:** Create cohesive regulatory guidelines that will support the development of standards risk assessments and increase transparency on AI models.
 - **Standardized Risk Assessment and Validation Requirements:** Create frameworks that evolve into formal accreditation, ensuring baseline of quality across industry.
 - **Transparent AI models:** Increase transparency requirements for AI models used in clinical care.

ISSUE

Despite AI’s potential to enhance healthcare delivery and patient care, the high cost of AI and integration challenges remain the most significant barriers to adoption. Healthcare leaders identified the expense of AI development and deployment as a top obstacle, with many hospitals and health systems finding it difficult to invest in AI technology due to limited budgets and unclear return on investment. This financial barrier slows innovation and can widen the gap between well-funded institutions and resource-limited ones, since only organizations with substantial capital can afford to experiment with cutting-edge AI tools. Additionally, integration with existing systems and complex clinical workflows presents a major challenge, as many healthcare IT infrastructures—particularly legacy electronic health record (EHR) systems—are not designed to accommodate AI outputs or data streams seamlessly. As a result, even promising AI solutions fail to progress beyond pilots, as clinicians face disruptions from their workflows and have difficulty juggling multiple software systems. Without addressing these significant barriers, AI’s potential to transform healthcare will remain largely untapped.

KEY INSIGHTS

AI is already transforming healthcare, and institutions are working to navigate its complexities. To better understand the landscape, Domelabs AI surveyed healthcare leaders and synthesized their anonymous responses to identify key challenges, priorities, and impactful policy actions.

Key Insights: Top 3 Critical Areas (Plus Close Runner-Ups)

Top 3 Critical Areas	Close Runner-Ups
• AI Security and Cybersecurity Safeguards	• High Costs of AI Development and Deployment • Integration Challenges with Existing Systems and in Clinical Workflows • Federal funding for AI research and infrastructure

- | | |
|---|--|
| <ol style="list-style-type: none"> 2. Clear Regulatory Frameworks + Standardized Risk Assessment and Validation Requirements 3. Greater Transparency requirements for AI models used in clinical care | <ul style="list-style-type: none"> • Development of Reimbursement models for AI-driven care • AI Workforce training for healthcare executives and clinicians |
|---|--|

Recommendations

1. Establish Clear AI Regulatory Guidelines

Create cohesive regulatory frameworks for healthcare AI that delineate roles, responsibilities, and requirements within industry and from vendors.

- **Create regulatory frameworks:** The federal government could issue guidance on AI algorithm approval processes (similar to FDA pathways for medical devices), data standards, and ethical use of AI in clinical decision-making. It will standardize risk assessments and validation requirements.
- **Standardize Risk Assessment and Validation Frameworks:** These might include standardized testing for accuracy, bias, and safety (for example, benchmarking an AI diagnostic tool on a representative patient dataset before approval). By establishing transparent validation criteria, the government can help healthcare organizations distinguish high-quality AI products from unreliable ones.
- **Require transparency for AI models used in clinical care:** Transparency on AI models from commercial products and internally developed models will ensure consistent standards and allow faster implementation of products, reassuring providers of its security and responsible usage.

Anticipated Benefits: Clear rules of the road will reduce uncertainty, giving hospitals and developers confidence about what is allowed and expected when deploying AI solutions.

2. Strengthen AI security and privacy protections

Federal AI security standards are critical for protecting sensitive health data and accelerating responsible AI adoption. Three out of four respondents claimed that stronger federal AI cybersecurity mandates would drive increase AI adoption in healthcare.

- **Develop and enforce robust security standards:** Develop and determine a criterion for certifying AI software that meets cybersecurity benchmarks and integrates HIPAA guidelines, addressing AI-driven data sharing and protecting sensitive patient data.
- **Public-Private Collaboration:** Establish a task force that brings together tech companies, healthcare organizations, and federal agencies to co-develop privacy and privacy technology standards, encryption protocols, and data governance best practices for AI-driven healthcare solutions.

Anticipated Benefits: By safeguarding patient data and system integrity, policymakers will foster greater trust in AI tools among providers and patients alike.

3. Funding and Incentives for AI development

Many healthcare systems are struggling to adopt AI rapidly due to limited resources and the uncertainty around the return of investment, but through federal guidance and incentives this challenge can be addressed to accelerate the deployment of AI.

- **Expand Federal Funding Programs:** Direct investment (grants, research awards, innovation challenges) can help drive down the high costs of development by supporting academic and industry collaborations, open-source toolkits, and shared infrastructure (like cloud platforms or healthcare data trusts).
- **Pilot Incentives:** Consider incentives such as tax credits or public-private partnerships to encourage healthcare organizations to pilot and implement AI systems, offsetting initial costs and demonstrating value.

- **Enable reimbursement for AI-assisted care:** Collaborate with Medicare, Medicaid, and private insurers to update reimbursement models for clinically validated AI interventions, ensuring providers are incentivized to adopt AI tools that improve patient care, with early federal support driving broader insurance acceptance.

Anticipated Benefits: An increased deployment of AI tools, pilot programs, and advancement of AI due to financial incentives, increased capacity, and collaboration between healthcare systems and tech companies.

4. Facilitate Integration Through Standards and Infrastructure

Support the development of interoperability standards that make it easier to plug AI tools into existing health IT systems.

- **Develop AI Interoperability Standards:** Federal agencies and standards organizations (like HL7 or ONC) could collaborate on protocols for integrating AI outputs into electronic health records or hospital workflows.
- **Fund Interoperable AI Pilot Programs:** Funding pilot projects that demonstrate successful AI integration in diverse healthcare settings can produce best practices and reference architectures for others to follow.

Anticipated Benefits: If successful, it would reduce the technical and operational friction of adopting AI, so that implementation becomes as straightforward as adding a new module to an EHR.

Final Statement Healthcare

Domelabs AI identified the highest priorities for AI adoption in healthcare: 1) AI cybersecurity safeguards, 2) clear regulatory frameworks, 3) the financial barrier for AI development and deployment, and 3) integration challenges. We recommend policies that address these critical areas through clear AI regulatory guidelines, federal funding incentives, robust security standards, and interoperability standards.

Healthcare Survey Responses

Regulation Balance to Advance AI Adoption

The balance between federal, state, and industry regulation that would advance AI adoption in healthcare

Chart: Domelabs AI - Created with Datawrapper

Level of AI Regulation for Safe AI Adoption

The level of AI regulation healthcare leaders believe is necessary for ensuring safe AI adoption in healthcare

Source: Domelabs AI - Created with Datawrapper

Barriers to AI Adoption in Healthcare

The largest barriers to AI adoption identified by senior leaders in healthcare. (Rating the barriers from 1- 'Most Important' to 5- 'Least Important')

Actions and Resources to Transform Healthcare AI Adoption

Healthcare leaders identified the federal actions and resources that would best support transformative and responsible AI adoption in healthcare. (Rating from 1- 'Most Impactful' to 5- 'Least Impactful')

Chart: Domelabs AI • Created with Datawrapper

AI Policy Priorities to Advance AI Adoption in Healthcare

AI policies that healthcare industry leaders deemed highest priority for the federal government to advance AI adoption (Rating the policies from 1- 'Most Important' to 5- 'Least Important')

4. Balancing National Consistency and Preventing Federal Overreach

Issue

Without cohesive federal action, states have already begun to enact divergent AI policies. This may lead to a fragmented regulatory landscape that complicates compliance and stifles innovation. At the same time, excessive centralization of AI regulation risks suffocating the entrepreneurial spirit.

Recommendations

1. Federal Legislative Package

- **Policy Action:** Preempt a patchwork of conflicting state regulations by enacting consistent national standards.
 - **Outcome:** Businesses can innovate with clarity, avoiding the pitfalls of navigating multiple state-level regulations.
2. **Support the Establishment of Self-Regulatory Organizations (SROs)**
 - **Policy Action:** Position SROs to craft and enforce AI guidelines, informed by industry expertise, while maintaining federal checks and balances.
 - **Outcome:** An agile system that can evolve with the technology without imposing rigid mandates that discourage rapid innovation.

5. Protecting Free Speech and Leading Globally Through Open-Source AI

Issue

Powerful foundation models raise questions about who determines if they are “safe.” A purely federal, top-down certification approach can risk ideological or political biases, potentially stifling innovation and suppressing free speech. Another dimension of open-source technologies is global competition. Despite significant growth and innovation in open-source AI across allied nations, Chinese companies are quickly advancing in the global open-source AI ecosystem, posing strategic and innovation-related challenges.

Recommendations

1. **Open Source and Multiple Models**
 - **Policy Action:** Encourage an ecosystem of competing AI models—open-source projects and private offerings—rather than funneling everything through one centralized “certification.”
 - **Outcome:** Fosters innovation, avoids monopolies, and reduces the risk of censorship or undue ideological influence.
2. **Minimal Top-Down Approvals**
 - **Policy Action:** Limit government intervention to clearly articulated safety standards, avoiding burdensome “one-size-fits-all” processes.
 - **Outcome:** Preserves freedom of voice and allows for diverse viewpoints and emerging technologies to flourish.
3. **Official Recognition of Open-Source AI**
 - **Policy Action:** Publicly affirm the importance of open-source AI for innovation, free speech, and technological democratization.
 - **Outcome:** Enhanced governmental and public sector support and clearer strategic commitment to open-source projects.
4. **Enhanced Federal Funding for Open Source AI Initiatives**
 - **Policy Action:** Allocate targeted federal investments and incentives for collaborative open-source AI research and development.
 - **Outcome:** Increased innovation, competitive advantage, and diversity within the AI landscape.
5. **Prioritize Federal Adoption of Open-Source AI Tools**
 - **Policy Action:** Promote active adoption and contribution to open-source AI technologies within federal agencies.
 - **Outcome:** Improved governmental transparency, public accountability, and trust.
6. **Balanced Regulatory Frameworks**
 - **Policy Action:** Design regulatory frameworks that protect innovation while avoiding unnecessary burdens on collaborative and small-scale AI projects.
 - **Outcome:** Sustained community innovation and widespread contributions to AI development.
7. **Promote Global AI Collaboration and Standardization**
 - **Policy Action:** Facilitate international collaboration and unified global standards in open-source AI that create a level playing field so that the best technical solutions emerge.
 - **Outcome:** Greater global competitiveness, technological alignment, and responsible development of AI.

6. Optimizing Workforce Alignment and Education for American Leadership

Issue

The integration of AI—particularly, agentic AI and autonomous systems—across industries is driving a significant transformation of the workforce, requiring a shift in workforce education to bridge existing skill gaps. While AI has the potential to augment productivity and enhance efficiency, traditional educational models are ill-equipped to support the scale and speed of reskilling required. AI literacy level must be expanded not only for workers in high-automation industries but also for policymakers, non-technical professionals, and cybersecurity experts, ensuring they can both mitigate AI-related risks and leverage advanced AI to enhance their roles.

Recommendations

1. Education Overhaul

- **Policy Action:** Revamp K-12 and higher education by embedding AI literacy, equipping students with the skills to navigate, leverage, and drive innovation alongside AI across disciplines.
- **Outcome:** A workforce equipped to coexist and collaborate, and compete in an AI-driven economy, with critical thinking, ethical reasoning, cybersecurity awareness, and human-centric problem-solving skills that AI cannot replicate.

2. Reskilling Programs

- **Policy Action:** Implement large-scale AI training initiatives for workers, ensuring they can adapt, integrate, and enhance AI-driven processes with human expertise and strategic decision-making. Provide targeted retraining for workers displaced by automation, equipping them with new, in-demand skills to transition into AI-augmented industries.
- **Outcome:** A workforce prepared for AI-driven transformation, minimizing displacement, boosting economic resilience, and reinforcing a competitive edge in the global market. A smoother transition for displaced workers, reducing unemployment risks while expanding the talent pipeline in high-growth industries.

3. Continuous Upskilling

- **Policy Action:** Advance and maintain AI proficiency, ensuring the workforce can leverage AI-driven tools, adapt to evolving job roles, and navigate emerging industry transformations. Training should include AI advancements, including cybersecurity risks, regulatory frameworks, and sustainability challenges, so non-technical workers remain informed and agile in a rapidly shifting landscape.
- **Outcome:** A workforce that continuously evolves alongside AI, equipped to anticipate security threats, uphold AI policies, and drive energy-efficient innovation. Remain at the forefront of AI innovation while safeguarding national security, economic strength, and environmental sustainability.

7. Enhancing Federal Law Enforcement and Intelligence Capabilities

Issue

Federal agencies—ranging from law enforcement to the intelligence community—cannot modernize quickly enough without dedicated AI-specific funds. Merely increasing budgets or issuing directives often fails to guarantee that money is actually spent on AI.

Recommendations

1. Earmarked “Use-It-or-Lose-It” AI Funds

- **Policy Action:** Allocate appropriations that can **only** be spent on AI solutions, which expire if not utilized within a set timeframe.
- **Outcome:** Strong incentives for agencies (DoD, DHS, DOJ, IC) to adopt AI swiftly, develop new capabilities, and address security threats more effectively.

2. Inter-Agency AI Task Forces

- **Policy Action:** Foster collaboration among agencies to share best practices and avoid duplicative AI efforts.
 - **Outcome:** Streamlined, cost-effective AI deployment across federal law enforcement and intelligence operations.
3. **Integration of Real-Time Intelligence and Automated Evidence Management Platforms**
- **Policy Action:** Leverage a unified network of AI-powered surveillance systems, incorporating connected cameras, sensors, and cloud-based real-time intelligence centers, to deliver actionable insights in real-time. Integrate automated image search, transcription, and redaction tools to expedite evidence processing and reporting.
 - **Outcome:** Enhanced situational awareness and faster, data-driven decision-making will improve response times and operational efficiency while ensuring that critical information is processed accurately and securely, ultimately bolstering public safety.

8. Securing the Homeland with AI-Driven Border Security

Issue

Borders remain vulnerable to trafficking and illegal activities; however, AI-driven surveillance, drones, and real-time analytics can help mitigate these threats. A well-structured “Digital Wall Initiative” also has significant potential to spur economic development in border regions.

Recommendations: The Digital Wall Initiative

1. Multi-Modal Surveillance Infrastructure

- **Policy Action:** Employ AI-integrated drones (aerial, terrestrial, maritime), advanced sensors, thermal imaging, and anti-jamming systems for 24/7 border monitoring. This system would be managed under a comprehensive governance framework that includes appropriate oversight and data protection measures, ensuring adherence to domestic and international legal standards.
 - **Scope & Cost:**
 - **\$8–\$9 billion** over 5 years for AI analytics, ground sensors, networking, and ongoing operations, deployed across **2,000+ miles** of land and maritime borders.
 - **Sister Digital Wall** at the Darién Gap in Panama and along the Panama Canal, cost-shared with the Panamanian government and manned by a joint U.S.-Panama task force, extends real-time intelligence on trafficking routes and canal-related strategic and threat intelligence.
 - **Adaptive Decision-Making Layer with Predictive Flow Management** that uses AI to aggregate real-time data (climate, economic, geopolitical, social media) and forecast immediate migration surges. Its purpose is to automatically trigger resource scaling and coordinate agency responses, ensuring that processing adapts swiftly during spikes to minimize bottlenecks and maintain operational efficiency.
 - **Live Virtual Constructive Evaluation with Scenario Analysis and Pattern Detection** leverages an AI-driven simulation platforms to test “if-then” scenarios and uncover long-term patterns in illegal migration and trafficking, offering a strategic lens for evidence-based policy analysis to inform long-term policy optimization.
- **Outcome:** Automated threat detection, predictive analytics to reduce illegal cross-border activity by an estimated **40–60%**, and improved national security.

2. Community-Centric Investment and Economic Development

- **Policy Action:** Pair security enhancements with investments in **\$5–\$7 billion** worth of broadband/5G expansion, transportation, workforce training, and small business grants in border regions, Puerto Rico, and the U.S. Virgin Islands.
- **Outcome:** Creation of **75,000+ jobs**, boosts to local GDP by **\$70–\$120 billion** annually, and a unified strategy that integrates security and economic growth.

9. Strengthening the Defense Industrial Base

Issue

Modernizing U.S. defense capabilities requires both technical innovation and addressing profound structural challenges within the defense industrial base. Recent analysis indicates that competition in the defense sector has sharply declined—prime contractors have consolidated from 51 to fewer than 10—leaving traditional suppliers with near-monopoly positions. This consolidation, coupled with the defense industrial base’s increasing isolation from the broader commercial economy, limits capital investment in new technologies, stifles innovation, and hampers the DoD’s surge capacity. In a potential conflict, for example, a war in the Taiwan Strait, CSIS war games and independent analyses warn that U.S. munitions (particularly long-range, precision-guided systems) could be depleted in less than a week. Moreover, Chinese adversaries are actively targeting the defense industrial base through economic statecraft and cyber-attacks aimed at stealing intellectual property, disrupting supply chains, and compromising critical infrastructure.

Recommendations

1. **Enhance Existing Weapons Platforms**
 - **Policy Action:** Integrate AI to improve range, precision, and durability of current systems (e.g., fighter jets, naval vessels, missile defense).
 - **Outcome:** Prolongs platform lifecycles, maximizes taxpayer value, and maintains a credible deterrent posture.
2. **Invest in Next-Gen AI-Enabled Systems**
 - **Policy Action:** Develop advanced drones, new weapons platforms, and hypersonic missiles that harness state-of-the-art AI, addressing current capability gaps.
 - **Outcome:** Ensures the U.S. stays ahead in the strategic competition with peer adversaries by fielding cutting-edge systems that combine AI, robotics, and high-speed delivery mechanisms.
3. **Cybersecurity and Vulnerability Exploitation Modeling**
 - **Policy Action:** Deploy specialized Large Language Models (LLMs) and advanced analytical techniques to examine weapon system codebases, network traffic, and threat intelligence.
 - **Outcome:** Improved cyber resiliency and enhanced survivability of critical defense systems by enabling timely “blue” team assessments and providing actionable inputs for DoD red team operations.
4. **Automated Tactical Decision-Making**
 - **Policy Action:** Utilize AI/ML to automate the generation of tactical Course of Action (CoA) recommendations by integrating extensive tactical data and aligning outputs with established Tactics, Techniques, and Procedures (TTPs) and Standard Operating Procedures (SOPs).
 - **Outcome:** Drastically reduced decision-making time and risk during operations, enabling rapid and dynamic replanning that enhances mission success.
5. **Predictive Maintenance and Advanced Training**
 - **Policy Action:** Employ AI-based predictive maintenance to forecast system failures and integrate human-in-the-loop controls in semiautonomous systems; additionally, utilize Live Virtual Constructive Training (LVC) environments for immersive, cost-effective readiness programs.
 - **Outcome:** Increased system reliability, prolonged asset lifespans, and enhanced preparedness of personnel through realistic and efficient training modalities.
6. **Interoperability and Generative Tactical Simulation**
 - **Policy Action:** Adopt open standards and modular architectures that enable seamless integration of new AI systems with legacy platforms and allied systems, and utilize generative AI to simulate realistic tactical scenarios that support next-generation command and control (C2) initiatives.
 - **Outcome:** Improved coordination and communication across multi-domain operations, resulting in more effective and agile tactical planning and execution.

10. Secure Scaling AI Infrastructure and Energy Supply

Issue

Rapid growth in AI significantly increases electricity demand, potentially consuming 325–580 TWh by 2028 (6.7–12% of U.S. electricity usage), while reliance on overseas semiconductor manufacturing creates geopolitical risks. Energy consumption is generally expected to increase in line with AI innovation scaling.

Recommendations

1. **Expand Domestic Energy Production**
 - **Policy Action:** Streamline permitting processes for oil, natural gas, nuclear, and renewable energy projects.
 - **Outcome:** Stable, affordable energy supply to meet growing AI infrastructure demands.
2. **Establish Strategic AI Energy Hubs**
 - **Policy Action:** Create dedicated energy facilities specifically designed for AI infrastructure needs.
 - **Outcome:** Reliable and consistent energy sources tailored to the AI industry's expanding requirements.
3. **Invest in Domestic Semiconductor Manufacturing**
 - **Policy Action:** Significantly increase domestic semiconductor production capabilities to reduce dependency on foreign manufacturers.
 - **Outcome:** Improved national security and economic stability by mitigating geopolitical risks.
4. **Increase Federal AI Research and Workforce Development Funding**
 - **Policy Action:** Target annual funding levels of \$25–30 billion by 2030 for AI research and workforce development initiatives.
 - **Outcome:** Sustained GDP growth at 5–6%, effectively maximizing AI's economic and societal benefits.
5. **Promote Open Standards and Interoperability**
 - **Policy Action:** Establish open standards to encourage innovation and competition in the AI market.
 - **Outcome:** Prevention of monopolies and increased accessibility of diverse, innovative AI technologies.

11. AI Cybersecurity

Issue

The integration of AI technologies into various sectors, including critical infrastructure, has led to complex cybersecurity challenges. Notably, cyber incidents have risen significantly, with AI-enabled cyber threats becoming more sophisticated. For instance, 80% of bank cybersecurity executives feel they cannot keep up with AI-powered cybercriminals, and consumers have lost over \$1 trillion to scams. There is an urgent need for robust cybersecurity measures and capabilities across defensive and offensive dimensions of traditional IT and AI systems.

Recommendations

1. **Establish Comprehensive National AI Cybersecurity Standards and Protocols**
 - **Policy Action:** Develop uniform and comprehensive AI cybersecurity standards across industries and government entities.
 - **Outcome:** Consistent and effective cybersecurity responses, reducing vulnerabilities nationwide.
2. **Facilitate Strategic AI Cybersecurity Data and Model Sharing**
 - **Policy Action:** Enhance data and model-sharing practices through strategic public-private and academic partnerships.
 - **Outcome:** Accelerated development and adoption of advanced AI-driven cybersecurity solutions.
3. **Expand Specialized Training Programs in AI Cybersecurity**
 - **Policy Action:** Develop targeted AI cybersecurity training initiatives for federal law enforcement and public-private partnerships.

- **Outcome:** Strengthened national cybersecurity expertise, improving resilience against evolving cyber threats.

12. Introducing AI-Driven Telehealth for Systematic Healthcare Transformation

Issue

AI-powered telehealth is the only technology innovation vertical that has the potential to transform how the entire US healthcare functions. Completely redesigning care delivery and advancing the introduction of AI doctors, telehealth can make way for capabilities that traditional care delivery models cannot. Expanding access to care, reducing costs, and improving patient outcomes are key priorities, yet integration challenges, regulatory uncertainty, and reimbursement challenges slow adoption. Without consistent federal policies and clear technical standards, AI-enabled telehealth tools may be limited in their adoption and transformative potential.

Recommendations

1. Improve AI Telehealth System Interoperability

- **Policy Action:** Reduce the barriers that make integration into Electronic Health Records difficult by establishing interoperability protocols that enable seamless integration of AI-driven telehealth solutions.
- **Outcome:** Reduction of technical challenges which will increase the implementation of AI telehealth systems into healthcare organizations.

2. Establish Clear Telehealth Standards

- **Policy Action:** Develop federal guidelines for AI-driven telehealth solutions to ensure safety, reliability, and compliance with existing healthcare regulations.
- **Outcome:** Provides regulatory clarity, helping healthcare providers adopt AI-driven telehealth tools with confidence while maintaining high standards of care.

3. Modernize Reimbursement Models for AI-Enabled Telehealth

- **Policy Action:** Work with Medicare, Medicaid, and private insurers to ensure clinically validated AI-driven telehealth services (e.g., AI-assisted diagnostics, remote monitoring) are eligible for reimbursement
- **Outcome:** Encourages greater provider adoption by ensuring AI-powered telehealth solutions are financially sustainable and integrated into standard billing models.

13. Quantum Leadership to Future-Proof AI Leadership

Issue

Quantum computing has the potential to revolutionize AI and ensure future AI leadership by dramatically increasing computational power, enabling faster model training, improved optimization, and advanced problem-solving capabilities. However, technical limitations, cybersecurity risks, and lack of clear federal strategies present significant challenges that may expose critical systems to security vulnerabilities posed by quantum decryption capabilities.

Recommendations

1. Develop a Federal Quantum AI-Strategy

- **Policy Action:** Establish a national roadmap for integrating quantum computing with AI, outlining use cases, research priorities, and security considerations across government and industry.
- **Outcome:** Provides long-term strategic direction for quantum-AI advancements while ensuring coordinated federal support and investment in research, security, and workforce development.

2. Secure AI Against Quantum Threats

- **Policy Action:** Mandate the development of post-quantum cryptography standards to protect AI models and sensitive data from quantum decryption capabilities.
- **Outcome:** Ensures AI systems remain secure in a post-quantum era, preventing adversarial attacks that could compromise healthcare, defense, and financial AI applications.

3. Expand Quantum-AI Research and Development

- **Policy Action:** Increase federal funding for research programs focused on quantum-enhanced AI applications, such as quantum machine learning, AI-driven quantum simulations, and real-time decision-making optimizations.
- **Outcome:** Accelerates breakthrough innovations in AI, allowing the U.S. to maintain a global leadership position in quantum-AI advancements.

14. Strengthening American Security and Innovation with Privacy-Preserving AI

Issue

The United States must lead in AI while protecting national security, privacy, and economic strength. Fragmented data across intelligence, healthcare, and finance limits AI-driven security and research. Without scalable, privacy-preserving technologies, America risks falling behind global competitors, particularly authoritarian regimes that exploit AI for surveillance and control. A government-controlled or one-size-fits-all regulatory model would stifle innovation, erode constitutional freedoms, and centralize power in Washington. Instead, the U.S. must advance Privacy-Preserving Technologies (PPTs), including Federated Learning (FL), to enable secure, data-driven decision-making while keeping AI development decentralized and market-driven.

Recommendations

1. **Deploy Privacy-Preserving AI to Strengthen National Security Without Expanding Federal Control**
 - **Policy Action:** Enable intelligence-sharing and threat detection through Privacy-Preserving Federated Learning (PPFL) while safeguarding privacy and constitutional freedoms.
 - **Outcome:** Allows agencies and private-sector innovators to collaborate across rare and highly sensitive datasets without exposing raw information. Protects individual rights while improving real-time responses to national security threats. Prevents centralized AI control, ensuring diverse innovation and competition.
2. **Establish a Secure Federated Data Access Framework**
 - **Policy Action:** Allow AI models to train on critical datasets without direct access to classified intelligence or private health records.
 - **Outcome:** Enables secure, cross-sector collaboration between government, industry, and academia while respecting privacy and civil liberties. Strengthens AI-driven early warning systems for national security threats. Empowers private-sector AI development without relying on burdensome federal oversight.
3. **Expand AI Testbeds to Ensure Safe and Secure AI Deployment**
 - **Policy Action:** Establish controlled test environments to refine AI models for national security applications while maintaining trust and security.
 - **Outcome:** Ensures AI models are tested under safe, secure, and trustworthy conditions. Strengthens cross-sector partnerships between intelligence agencies, research institutions, and industry leaders. Prevents the federal government from imposing restrictive AI regulations that slow innovation.

15. Advancing AI-Enabled Open Source Intelligence (OSINT) for National Security

Issue

Modern conflicts and geopolitical threats increasingly rely on Open Source Intelligence (OSINT) to track adversarial movements, counter disinformation, and develop actionable insights. The Israel-Gaza conflict demonstrated the strategic role of OSINT in identifying military activity, psychological operations, and disinformation campaigns. Yet, the United States lacks the AI-enabled automation necessary to process publicly available information (PAI) at scale, leading to intelligence delays that weaken national security and decision-making. Currently, manual workflows, outdated translation tools, and slow data processing hinder agencies like the National Air and Space Intelligence Center (NASIC) and the broader Department of Defense (DoD). The time required to convert raw OSINT into actionable intelligence allows more nimble adversaries to move weapons, personnel, and assets into position before U.S. forces can respond. Without AI-driven automation, the United States will continue ceding the advantage to adversaries that capitalize on our constrained response times.

Recommendations

1. **Deploy AI-Powered OSINT to Strengthen National Security**
 - **Policy Action:** Integrate AI-driven transcription, translation, and contextual analysis to process OSINT accurately and at scale.
 - **Outcome:** Reduces intelligence processing time from days to hours, enabling faster decision-making for military and counterintelligence operations. Improves threat detection by identifying adversary disinformation, force movements, and attack planning in real-time. Enhances coordination between intelligence agencies and operational forces by providing consistent, machine-readable intelligence reports.
2. **Establish Secure AI Infrastructure for OSINT Across Government and Private Sectors**
 - **Policy Action:** Develop a trusted AI perception framework that enables real-time intelligence sharing across decentralized multi-intelligence (multi-INT) data sources.
 - **Outcome:** Could support operations like Joint Interagency Task Force (JIATF)-South counter-narcotics operations and Pacific Command (PACOM) intelligence efforts by accelerating target identification. Enhances public-private collaboration by enabling private-sector security analysts to detect threats from cyberattacks, supply chain disruptions, and foreign influence campaigns. Provides secure AI-driven analysis of structured and unstructured data, reducing human workload while maintaining accuracy.
3. **Modernize Contextual Understanding in OSINT Systems**
 - **Policy Action:** Improve the ability of AI systems to capture, process, and interpret evolving battlefield conditions without information loss.
 - **Outcome:** Eliminates intelligence blind spots caused by outdated ontologies that cannot rapidly adapt to changing military or geopolitical conditions. Prevents data corruption and misinterpretation by synchronizing machine-readable intelligence across distributed OSINT systems. Strengthens interoperability between human analysts and AI-driven intelligence systems by maintaining real-time context across operations.

16. Global Stability with International Collaboration on Autonomous AI

Issue

AGI-level systems transcend borders, with potential global risks comparable to nuclear technology. While there are concerns about adversaries like China not adhering to mutual commitments, some areas of AI development inevitably demand international collaboration.

Recommendations: Diplomatic Engagement and Agreements

1. **International Cooperation**
 - **Policy Action:** Pursue agreements akin to nuclear accords, focusing on safe AGI development and global norms that reduce arms-race dynamics.

- **Outcome:** A shared set of protocols that ensure responsible AI deployment, thereby mitigating systemic risks.
2. **Selective Collaboration with China**
 - **Policy Action:** Recognize that certain AI advances—particularly advanced forms of AGI—may pose existential risks and require joint guardrails.
 - **Outcome:** Avoids chaotic escalations, promotes global stability, and upholds American security and technological leadership.

17. AI-Driven Government Transformation Through DOGE: From Deconstruction to Innovation

Issue

The U.S. government must transition from a workforce reduction and cost-cutting approach to an AI-driven, innovation-first model. The healthcare.gov crisis under the Obama administration demonstrated how private-sector technology expertise could modernize government operations, leading to initiatives like the U.S. Digital Service (USDS) and the Presidential Innovation Fellows. With the integration of DOGE into USDS, there is a rare opportunity to build an AI-first government that is more efficient, responsive, and citizen-focused. However, without a structured AI transformation strategy, federal agencies risk fragmented adoption, inefficiencies, and a failure to leverage AI's full potential.

Recommendations

1. Launch New AI Innovation Programs and Expand Existing Initiatives

- **Policy Action:** Launch new programs through DOGE and expand programs like the Presidential Innovation Fellows and the U.S. Digital Corps to deploy AI specialists and innovators in modernizing government services, automating inefficiencies, and improving citizen interactions. Establish new AI-first digital transformation teams within key federal agencies to drive strategic AI adoption, shorten acquisition cycles, and create a more risk tolerant culture among federal workers.
- **Outcome:** Ensures government services are optimized through AI-driven automation, improving responsiveness, accessibility, and efficiency while maintaining non-partisan standards.

2. Develop an AI-First Digital Framework

- **Policy Action:** Implement a structured AI-first framework that prioritizes automation, AI-powered chatbots, and data-driven decision-making while embedding strong ethical oversight and security protocols.
- **Outcome:** Enhances the efficiency and effectiveness of government processes by leveraging AI for administrative tasks, reducing bureaucratic delays, and ensuring transparent, accountable decision-making.

3. Scale AI Public-Private Partnerships

- **Policy Action:** Overhaul federal procurement policies to prioritize AI-native solutions, promote open-source AI adoption, and integrate cloud-based AI infrastructure to enhance interoperability across agencies.
- **Outcome:** Streamlines AI adoption by fostering collaboration between government and industry, ensuring access to cutting-edge AI technologies while maintaining security and oversight.

4. Implement AI Workforce Transition and Reskilling Programs

- **Policy Action:** Develop workforce transition programs to reskill government employees, equipping them with the skills necessary to work alongside AI tools rather than being displaced by them. Establish AI upskilling initiatives to prepare federal employees for AI-enabled roles.
- **Outcome:** Creates an AI-ready government workforce, reducing reliance on external contractors, ensuring smooth AI adoption, and maintaining institutional knowledge within agencies.

5. Ensure AI Governance and Strategic Implementation at the Federal Level

- **Policy Action:** Establish an AI governance body within the federal government to oversee AI policy alignment, security protocols, and ethical AI deployment. Ensure that AI-driven government transformation aligns with national priorities.
- **Outcome:** Guarantees responsible AI adoption, safeguards public trust, and ensures AI-driven modernization efforts align with long-term government objectives.

18. Ensuring Execution of the AI Action Plan by Creating a U.S. Chief AI Officer

Issue

While AI has the potential to transform national security, economic growth, and government efficiency, its adoption across federal agencies remains fragmented, inefficient, and misaligned with strategic priorities. The absence of centralized leadership has led to duplicative efforts, inconsistent governance, and cybersecurity risks, leaving agencies struggling to implement AI solutions effectively. A **U.S. Chief AI Officer (CAIO)** is essential to drive coordinated AI adoption, ensure security, and align AI investments with national objectives. However, the success or failure of this role depends entirely on the right **combination of expertise**—a mistake seen time and again when enterprises appoint leaders who lack key competencies, leading to costly failures.

The High Cost of Getting It Wrong

Many organizations, both in government and industry, have suffered major setbacks by appointing **AI leaders with a one-dimensional background**—whether technical, policy-driven, or business-oriented—without the ability to bridge these domains effectively.

- **The Engineer-Only Leader:** Deep technical expertise without business acumen leads to impressive AI models that never get adopted, wasting millions in R&D with no real impact.
- **The Policy-Only Leader:** Strong in regulation but lacking technical understanding, these leaders make bold proclamations yet struggle to translate AI into real-world applications, resulting in overregulation or ineffective policies.
- **The Business-Only Leader:** Excels in vision but lacks the technical grasp to execute, leading to misguided investments in impractical AI solutions that engineers know won't work—wasting resources and time.
- **The Domain-Blind Leader:** Understands policy, business, and technology but lacks sector expertise, risking misaligned, one-size-fits-all solutions that fail to meet the unique needs of government, healthcare, or defense.

Four Key Qualities

To avoid these pitfalls, the U.S. Chief AI Officer must be **an integrative leader** with four key competencies:

1. **Policy and Governance Expertise** – A deep understanding of AI regulation, ethics, and governance to shape federal AI adoption while maintaining public trust.
2. **Business Strategy Acumen** – The ability to translate complex AI concepts into actionable business goals, ensuring AI investments deliver measurable impact.
3. **Technology Fluency** – A firm grasp of AI's capabilities, limitations, and risks to drive realistic and secure implementations while avoiding hype-driven missteps.
4. **Domain Expertise** – A strong understanding of government, healthcare, national security, and other critical sectors to align AI adoption with unique operational and regulatory needs.

Recommendations

1. Establish the U.S. Chief AI Officer (CAIO) Role

- **Policy Action:** Create a federal CAIO position, reporting to the Director of the Office of Science and Technology Policy (OSTP), tasked with executing the National AI Action Plan.
- **Outcome:** Ensures cohesive AI adoption, minimizes redundancies, and aligns government AI initiatives with national security, economic, and ethical priorities.

2. Appoint a CAIO with Four Key Skillsets: Policy, Business Strategy, Technology, and Domain Expertise

- **Policy Action:** Select a CAIO with experience in policy and AI governance, business alignment, deep understanding of AI technologies, and domain expertise in government, national security, healthcare, and other critical sectors.
- **Outcome:** Ensures the national AI Action Plan is strategically implemented across public and private sector domains, avoiding past failures seen in single-discipline leadership.

3. Appoint a CAIO with Strong Public-Private AI Collaboration Experience

- **Policy Action:** Select a CAIO who has successfully led public-private AI partnerships, fostering collaboration between government, industry, and academia to advance AI innovation while maintaining federal oversight.
- **Outcome:** Enables government agencies to leverage cutting-edge AI technologies while ensuring AI adoption aligns with national security, public trust, and secure implementation.

By ensuring the National AI Action Plan will have dedicated and qualified leadership in the form of a U.S. Chief AI Officer, our nation will **avoid costly leadership mistakes** and drive AI maturity that is not only technically feasible, but strategically sound, economically impactful, and aligned with national priorities.

Conclusion: Ensuring American AI Leadership in a Changing World

The United States stands at a critical juncture. The policy choices made today will determine whether AI becomes a driver of American prosperity, security, and global leadership—or a force that undermines our competitive edge, national security, and societal stability. AI is not merely a tool for automation and efficiency; it is a transformative technology that will redefine industries, reshape governance, and reorient global power structures.

The recommendations outlined in this RFI response reflect a comprehensive strategy to accelerate AI adoption across federal agencies and healthcare, secure national AI infrastructure, balance regulatory consistency with innovation, and ensure AI-driven transformation aligns with democratic values. Strengthening AI cybersecurity, optimizing workforce development, and fostering AI-first governance will be foundational for maintaining a resilient and forward-thinking AI ecosystem. As AI systems transition from generative to agentic intelligence, and ultimately towards artificial general intelligence, regulatory and strategic frameworks must evolve accordingly. The United States must proactively shape AI's trajectory, investing in workforce alignment, public-private collaboration, and international AI governance structures to ensure stability and prevent adversarial states from dictating the global AI agenda.

Through decisive action, we can establish a future where AI not only enhances national security and economic competitiveness, but also serves as a pillar of American innovation and global cooperation. The time to act is now—before the governance gap widens and the opportunity for strategic leadership diminishes. By acting on the recommended policy priorities, the United States will secure its position as the world's AI leader, ensuring that AI advances in alignment with our values, our national interests, and our collective vision for a secure and prosperous future.
