Ella Bounos

My name is Ella Bounos and I am a graduating senior from Avonworth High School. I researched generative AI's impact on art for a semester course, and recently studied this administration's viewpoint of AI regulation. Based on my two months of student research, AI should be heavily monitored, especially with continuing advancements in this technology. While I agree that AI can be used as a tool to enhance people's work or even help generate ideas, it's also stealing other people's work. In my research, I talk about copyright when it comes to AI and art, and one of my sources questions whether copyright, patent, and trademark infringement apply to AI creations. In 2022, there was a case of 3 artists whose art styles were stolen by an image generator. The 3 artists weren't aware that the AI was being trained to use their art styles. With this being said, I think there should be a copyright infringement placed upon AI and a more elevated monitoring system when it comes to AI. Not only does generative AI concern artists, it can also put them out of business, even if AI generated art isn't considered real art. Please consider my concerns, thank you.
