Emily Sharp

Thank you for the opportunity to provide input on the Development of an AI Action Plan. I urge the government to prioritize the following:

- Resource efficiency and environmental impact:** Prioritize developing resource-efficient systems, particularly concerning water conservation, heat management, and responsible use practices. Implement innovative cooling solutions for data centers to mitigate their impact on local communities. Ensure methods used don't generate toxic impacts on these communities. Encourage research into energy-efficient algorithms and hardware.
- Data privacy:** Establish strict regulations to prevent the sale or unauthorized access of individual data input into AI systems by companies or government entities. Allow for carefully controlled use of data for training purposes while protecting individual privacy.
- Inclusive decision-making:** Ensure a comprehensive variety of expert perspectives, including scientists, creatives, and professionals from fields that AI models aim to replicate, are involved in shaping policies and development.
- Ethical development:** Develop comprehensive ethical guidelines for AI development to prevent exploitation of vulnerable populations and ensure fairness in AI applications. Promote transparent and explainable AI systems, especially in critical areas like healthcare, finance, and criminal justice.
- Workforce transition and education:** Implement policies to support workforce retraining and education programs to help workers adapt to an AI-driven economy. Address concerns about human job displacement through proactive measures and support systems. Again, involve these sectors in design of the support systems and retraining programs.
- International collaboration:** Pursue regulatory alignment with international partners to develop a common, technology-neutral definition of AI and a shared risk-based approach to AI regulation. Establish joint R&D projects with international partners to tackle global challenges. Engage in the development of global governance frameworks for AI, such as an intergovernmental panel on AI.
- Safety and security:** Develop robust safety measures and security protocols to prevent AI systems from being misused or compromised. Enhance international collaboration on AI safety and security measures.

Retain valuable parts of previous policies: Maintain and build upon the key elements of the Biden-Harris AI Executive Order 14110, including safety and security standards, privacy protections, equity and civil rights considerations, consumer protection measures, support for affected workers, and guidelines for responsible government use of AI.
