Eric Maticic

A humble request: Please ensure that every data element to fall under the scope of AI has a "Validated Formal Requirement" that can be traced to a current organizational doctrine. Too many times, system development gets rushed and the "How" is put before the "What". The United States Marine Corps did well with this, Defining the Requirements always came first. Here at HUD we struggle because the Orders and Directives that drive our data is not as clearly standardized and defined. One Department can say "Property" and the count will differ based on the inferred departmental meaning. Our information is limited to our interpretations when data is not clearly defined and standardized. This will exponentially worsen if AI algorithms are structured towards the same ambiguity. Every Data Element must be traced to a formal validated requirement, that can be verified in a specific policy and data element dictionary style appendix. Once this process is standardized and consistent, and commonalities are made; AI can flourish accurately.
