Introduction

To maintain and expand the United States' leadership in Artificial Intelligence, we must take an actionable, strategic approach. AI should not just be another tool used when convenient—it should be the foundation for optimizing government operations. To accomplish this, I propose a dual-policy framework:

1. AI First Policy – Ensuring successful AI adoption and integration across federal agencies.
2. AI Security Policy – Establishing governance, compliance, and security standards to protect AI-driven processes and data.

These policies, if executed correctly, will foster a thriving, streamlined, and efficient government, capable of making informed decisions while safeguarding national security and public trust.

AI First Policy: Driving AI Integration Across Federal Agencies

The AI First Policy aims to make AI an essential component of government workflows, ensuring measurable efficiency gains. However, AI adoption cannot be successful without education and feedback mechanisms that actively engage those who will use it.

1. High-Level AI Education Program

We must establish an AI literacy program for all technology-using personnel, structured around three core pillars:

- What AI is: Demystifying AI concepts.
- How AI works: Practical applications and real-world use cases.
- Why AI matters: Illustrating AI's transformative potential in government operations.

2. Real-World AI Use Cases as Learning Tools

This program should showcase actual AI implementations that have yielded efficiency improvements. By seeing tangible benefits, personnel will be more inclined to adopt AI solutions in their own workflows.

3. A Structured AI Feedback & Innovation Layer

To ensure grassroots innovation, we need a structured feedback process where government staff can propose AI-driven improvements to their own workflows.

- The Department of Government Efficiency (DOGE) (or equivalent agency) should serve as the intake body for AI adoption ideas.
- Ideas should undergo a formal vetting process that evaluates feasibility and potential return on investment (ROI).
- Once validated, ideas should enter an implementation pipeline, ensuring they are developed and tested for real-world use.

This bottom-up approach ensures that those who understand their work best have a voice in shaping AI-driven efficiency improvements.

4. AI Innovation Loop: Let the Process Self-Sustain

Once the feedback loop is established, the AI adoption process will naturally gain momentum. Employees who are engaged and empowered will share opportunities for AI optimization without mandates.

AI Security Policy: Establishing Compliance & Governance

AI implementation must be paired with strong security protocols to ensure that data—both internal and public—is handled responsibly and securely.

1. Continuous AI Compliance & Governance Framework

An ever-evolving compliance structure should serve as a universal standard for AI projects in government. This will:

- Ensure consistent security measures across all AI implementations.
- Protect sensitive government and citizen data from foreign and domestic threats.
- Prevent unauthorized AI transactions through robust logging and tagging mechanisms.

2. Secure AI Logging & Data Monitoring

Every AI execution—whether it's a request, transaction, or decision—must be fully logged and tagged with key attributes:

- Origination of the request (who/what initiated it).
- Mediums and receivers involved (who interacted with it).
- Stored conversation history and uploaded files at the message state (ensuring forensic traceability).

A specialized AI Security Team with the highest clearance levels should be responsible for monitoring this data, ensuring:

- Threat detection and mitigation using AI-powered security analytics.
- Process optimization insights from AI-driven operational data.
- Security-first AI innovation, balancing compliance with efficiency gains.

3. Process Audits & Continuous Oversight

To maintain accountability and transparency, a specialized AI Security & Compliance Task Force should be established to:

- Conduct routine AI audits across federal agencies.
- Follow AI-driven processes downstream, identifying efficiency gaps and potential risks.
- Provide recommendations on cost-effective AI solutions with clear ROI projections.

This ensures that every AI-driven process remains efficient, ethical, and secure.

Final Thoughts: A Balanced, Human-Inclusive Approach to AI

An AI-driven government must not mean a government that removes humans from the equation. Instead, AI should serve as a force multiplier, allowing government personnel to focus on higher-value tasks while AI handles the repetitive, data-driven aspects of governance.

By implementing this AI Action Plan, the United States will remain ahead of global AI advancements while protecting national interests.

If done right, we will build a smarter, faster, and more efficient government—one that is prepared for the future and committed to serving its constituents at the highest level.

I appreciate the opportunity to contribute to this critical discussion. If there is any need for clarification or further elaboration, please do not hesitate to reach out. It would be an honor to assist our country in future planning and execution of its AI strategy.
