Eva Koebel

Hello. I'm a graduating senior from Pittsburgh, PA. For a semester-long English course, I researched the impact of generative AI on mental health, and we recently studied the administration's viewpoint on AI regulation. Based on the months of research I conducted, I think that is detrimental to current mental healthcare systems. AI algorithms have immense biases and often discriminate based on these biases. This leads to unequal treatment that could potentially harm patients rather than assist them. I also found that AI could undermine the benefits of person-to-person care that comes with the medical field. From an ethical perspective, this raises the concern of human autonomy. If we are to begin relying on robots to conduct assessments or act as therapists, there is a large disconnect. More regulation needs to be put in place to limit the usage of AI in certain fields. Keeping it away from patient-doctor interactions is crucial to prevent these concerns from prospering. Thank you for your time and for hearing my concerns/opinions!
