

Frank Broen

I support the government's role in providing guard rails to the development of AI. AI has proven to be both a useful tool and capable of providing completely fake answers. Any policy must provide guardrails to ensure that the data used to train AI does not contained bias. That bias is being encouraged through the current political climate, and may impact the 'decisions' made by the AI tool. The Arbinger Institute provides excellent guidelines that could be used in human to human interactions, by identifying "self justification." People will often self justify their own believes, especially if they are not aware of the "box" that they trap themselves in. AI should be required to identify and report the bias that influences the decision process.
