George Minas

1. Hardware and Chips: Strengthen Domestic Supply Chains Policy Action: Accelerate investment in domestic semiconductor manufacturing through targeted tax incentives and public-private partnerships, building on the CHIPS and Science Act framework. Prioritize production of next-generation chips optimized for AI workloads (e.g., GPUs, TPUs) to ensure U.S. companies have a competitive edge. Policy Action: Streamline export control policies to focus on genuine national security risks while avoiding blanket restrictions that inadvertently weaken U.S. firms' global market position. Reconsider partnerships with countries that might give away our tech to our adversaries (China, Russia, Iran, DPRK, terrorist groups). Conduct a 90-day review to assess the efficacy of current controls in light of foreign AI breakthroughs.

2. Energy Consumption and Efficiency: Power AI Growth Sustainably Policy Action: Establish a federal task force within 120 days to identify and designate "AI Energy Zones" on federal lands with access to abundant clean energy (e.g., nuclear, geothermal). Pair this with expedited permitting processes to operationalize data centers by mid-2027, reducing regulatory delays. Policy Action: Offer grants or low-interest loans to private entities developing energy-efficient AI hardware and cooling technologies, with a goal of reducing data center energy consumption by 20% within five years.

3. Innovation and Competition: Foster a Free-Market AI Ecosystem Policy Action: Create an "AI Innovation Sandbox" program within 180 days, allowing startups and small businesses to test AI models and applications with temporary exemptions from select regulatory requirements (e.g., data reporting). This would lower barriers to entry and accelerate market-ready solutions. Policy Action: Direct the Federal Trade Commission (FTC) to issue guidance within 120 days clarifying that antitrust enforcement will not penalize collaborative AI research among U.S. firms, provided it strengthens domestic competitiveness against foreign rivals.

4. National Security and Defense: Safeguard AI Leadership Policy Action: Mandate a joint Department of Defense (DoD) and intelligence community assessment within 150 days to identify critical AI technologies requiring enhanced protection (e.g., model weights, training datasets). Implement lightweight security protocols that safeguard these assets without hindering private sector collaboration. Policy Action: Increase funding for the DoD's AI programs by 25% in the FY2026 budget, focusing on autonomous systems and cybersecurity defenses against AI model attacks, ensuring the U.S. military remains ahead of strategic competitors.
