Hannah Sullivan

It is important that any US AI action plan take proactive measures against harmful uses of AI. These possible harms include using AI to generate child pornography or to generate false audio, images, and/or video which could negatively impact a person's reputation, or to generate and disseminate misinformation. Historically, the federal government has been slow and weak in their retroactive responses to problems posed by technological advances. We should take great care to avoid this being repeated with AI. Additionally, it is important that we minimize environmental effects of AI. AI is known to create higher levels of carbon emissions than previous uses of technology. I ask that the AI Action Plan create regulations to limit and/or offset carbon emissions resulting from the use of AI.
