Hari Chidambaram

I think there needs to be consideration of what AGI (Artificial General Intelligence) really means and the danger of creating AIs smarter than us in every way. AGI could mean that every human is out of a job (given that the AI can do anything that a human can do), and if it is not aligned with human interests, could also result in complete extinction. This is in addition to the concerns of power dynamics. I suggest global coordination to prevent race dynamics, resulting in safer development; banning open source AI to prevent dangerous actors from jailbreaking the models and any actor from improving it (to potentially dangerous levels); and simple, clear, transparency requirements for leading AI labs so we can see what is going on. Nationalization of AI might be needed at some point. Possible further resources: Superintelligence FAQ--
