Henry Amick

My name is Henry, and I am a graduating senior from a Western Pennsylvania High School. Recently, I completed a project researching the impacts of AI on Math Education in 2025, and the current administration's push for limited regulations on AI is extremely relevant to this field. My research has led me to believe that AI is an overall detriment to the American education system and that it should be kept out of schools. Heavy generative AI usage leads to a reduction in problem-solving ability and critical thinking skills in our youth. Young people becoming dependent on the assistance of AI is only amplifying a culture that discourages sustained attention, complex processing, and deeper engagement with the popularity of today's media forums. Whilst mass restrictions on AI may be seen as an infringement of rights, the reduction of AI accessibility in schools is paramount to supporting future generations of American citizens.
