

Public Comment on the Development of a Comprehensive AI Action Plan

To the Office of Science and Technology Policy and the Networking and Information Technology Research and Development National Coordination Office:

Thank you for the opportunity to submit comments regarding the development of a comprehensive Artificial Intelligence (AI) Action Plan.

As an attorney actively engaged in complex federal and state regulatory matters involving emerging technologies—including artificial intelligence, intellectual property, healthcare, and highly regulated markets—I provide these recommendations to shape a forward-looking, innovative, and practical national AI strategy:

1. Holonic and Decentralized Governance: Practical Frameworks

Adopting a holonic governance structure—a decentralized system of autonomous yet interconnected units ("holons")—can enhance AI governance significantly. While this model is still emerging, it parallels successful governance structures used in sectors such as supply chain management and internet governance, which rely on decentralization balanced by clear federal standards. In practice, this means designing AI policies that allow government agencies, businesses, and communities to innovate independently within national guidelines, fostering agility and responsiveness without sacrificing cohesive national oversight.

2. Balanced Regulatory Framework to Encourage Responsible Innovation

Clear yet flexible regulation is essential. Policymakers should encourage experimentation and innovation within well-defined ethical and security boundaries. Regulatory "sandboxes"—controlled environments already used in AI development by countries such as Singapore—should be expanded in the U.S. to allow innovators to experiment confidently without creating undue regulatory burdens. Such frameworks should explicitly clarify expectations regarding privacy, cybersecurity, and ethical practices, protecting the public while empowering innovation.

3. Strengthening American AI Leadership and Global Competitiveness

The United States must maintain leadership in AI by actively fostering strategic partnerships that expand American innovation, market access, and geopolitical influence. Initiatives should emphasize collaboration between U.S. technology leaders and key international markets, particularly in strategic regions such as Africa and Asia. These partnerships will open new economic opportunities, secure essential supply chains, and reinforce America's competitive edge. This approach aligns with existing national AI strategies, like the Global Partnership on AI (GPAI), and ensures continued American economic resilience and national security.

4. Resilient and Sustainable AI Infrastructure

Strategic investment in sustainable AI infrastructure is critical. This includes promoting renewable-powered data centers—already proven effective by companies such as Google, which leveraged AI to reduce data center cooling energy use by approximately 40%—alongside decentralized computing solutions and AI-integrated urban planning. Cities leveraging AI for traffic management, energy efficiency, and infrastructure maintenance demonstrate that such approaches are already practical, beneficial, and scalable. Integrating sustainability with infrastructure investment ensures future-proof growth in AI capabilities.

5. AI and Effective, Responsive Government

AI presents substantial opportunities to improve government efficiency, responsiveness, and transparency. Real-world applications, including AI-driven chatbots for rapid citizen service responses (as successfully implemented in various U.S. states) and predictive analytics for efficient resource allocation, already illustrate AI's transformative potential in governance. Moreover, AI-powered transparency initiatives—such as algorithmic transparency standards and automated data analysis to detect anomalies in public spending—will significantly enhance public trust and accountability. Governmental AI should continue emphasizing explainability, transparency, and responsible data practices.

6. Economic Empowerment and Inclusive Innovation

The AI Action Plan must ensure economic benefits extend to businesses of all sizes, particularly small businesses and entrepreneurial ventures. Supporting early-stage companies through targeted funding, simplified regulations, and public-private partnerships is crucial for broad-based innovation. This approach will catalyze job creation, encourage entrepreneurial innovation, and establish a dynamic, diverse AI economy.

7. Cross-Industry Innovation and Technology Transfer

Policies should encourage interdisciplinary collaboration and the transfer of technologies between industries to multiply AI's economic and societal benefits. A notable real-world example includes Harman International's acquisition of Caaresys, an automotive AI company developing radar sensing technology to monitor driver vital signs. Initially designed for automotive safety, such sensor technology is actively being explored for potential emergency

healthcare applications, demonstrating how cross-industry innovation drives economic growth and societal advancement.

8. AI-Enhanced Transportation Ecosystem

Transportation infrastructure presents a significant opportunity for AI-driven transformation. Policies should prioritize integrating AI into roads, highways, transportation management systems, automated trucking with dedicated lanes, and AI-integrated smart urban planning. Practical examples such as AI-managed traffic systems and predictive maintenance solutions already deployed in cities underscore the feasibility and substantial benefits of AI integration, delivering enhanced safety, economic productivity, and sustainable urban development.

9. Strategic Intellectual Property (IP) Policies

Given ongoing legal developments regarding AI-generated innovations, the Action Plan should clearly articulate updated IP guidelines. While current U.S. law requires human inventorship and authorship for IP rights, global discussions led by bodies such as the World Intellectual Property Organization (WIPO) signal the necessity for policy evolution. The Action Plan should proactively address these challenges by encouraging IP frameworks that clarify ownership of AI-generated outputs, balance incentives for innovation with public access, and leverage AI itself to improve IP management processes.

10. Transparency, Explainability, and Public Trust

AI implementations across government and industry require robust transparency and accountability. Clear explanations of AI-driven decision-making processes, independent auditing protocols, and mechanisms for public feedback and dispute resolution are critical to maintaining public confidence. Real-world initiatives such as the UK's Algorithmic Transparency Recording Standard serve as practical examples, underscoring the necessity for similar policies in the United States.

11. Strategic AI Talent Development

Developing a diverse, adaptable AI workforce through targeted education and workforce programs is crucial. Initiatives should integrate multiple cognitive approaches—linear, nonlinear, decentralized, systemic, and intuitive—to equip professionals comprehensively. While AI education and workforce strategies exist broadly, explicitly combining these cognitive approaches provides an innovative, comprehensive educational foundation essential for addressing complex AI challenges and maintaining competitive national advantage.

Thank you again for the opportunity to contribute to this important process. The above recommendations, grounded in current practice, legal realities, and innovative thinking, will position the United States as a global leader in responsible, sustainable, and transformative AI innovation.

Respectfully submitted,

Eric Postow
