Comment regarding AI Action Plan RFI:

Generative AI technology is cool, but it's not game-changing. It's a more advanced version of predictive text generation tools that were standard on cell phones 20 years ago. Modern AI systems use massive amounts of energy while their confident-but-wrong hallucinations make them unreliable and unsuited to important tasks. Much like Microsoft's Clippy, AI tools have been making the end-user experience more aggravating in many customer-facing contexts with no benefit.

AI tools may yet find some niches where they are overall useful and welcome but they are not essential to national security, they are not worth the massive energy drain, and they do not deserve to be propped up by intellectual property exceptions that would allow their for-profit owners to infringe copyrighted works. (If AI technologies really do have the unbounded potential they are promised to bring, then the owners should have little difficulty convincing investors to license any needed copyrighted works.)

AI companies have already profited from the theft of intellectual property; they should not get special treatment any further.
