Dear Mr. D'Souza,

Intuit welcomes the opportunity to provide comments informing the Trump Administration's development of a new AI Action Plan. We appreciate this administration's early and proactive involvement of industry leaders like Intuit in this process, which we believe is crucial for the United States to sustain and enhance America's global AI dominance to promote human flourishing, economic competitiveness, and national security.

In this submission, we describe (i) how Intuit uses AI to help 8 million American small and mid-market businesses not only survive, but grow and thrive; (ii) our approach to responsible AI governance; and (iii) our perspectives on the highest-priority topics for the Trump Administration to focus its AI Action Plan on to maximize the success of its AI policy goals.

This RFI rightly calls attention to several AI policy topics - all of which we agree are important to securing America's place as the AI innovation capital of the world. Our submission will focus on those policy areas that are most impactful to Intuit's consumer, and small and mid-market business customers. These recommendations are based on our years of experience building an AI powered platform to help level

turbotax

creditkarma

quickbooks

mailchimp

the playing field for American small businesses and help power financial prosperity for consumers.

We believe the AI Action Plan should address the following policy topics as well:

- Support for American small and mid-market businesses access to AI powered technology to power the economy
- Avenues for public-private collaboration on AI policy development
- Reducing compliance costs and burdens to American AI innovators caused by regulatory fragmentation at the state level
- AI Literacy efforts to educate and provide access to tools that can boost economic growth and efficiency

In sum, we support a risk-based, context-specific approach to AI policy that offers appropriate protections against unintended consequences while avoiding labeling and regulating entire sectors as high-risk. To maintain America's global leadership, we also believe that sound AI policy needs to help increase AI adoption by consumers and small businesses, and foster innovation and competition that benefits US households and small businesses.

About Intuit

Intuit is a global financial technology platform that believes everyone should have the opportunity to prosper. We never stop working to find innovative ways to make that possible. Serving approximately 100 million customers worldwide with small businesses productivity tools such as [Quickbooks](#) and [Mailchimp](#), and personal finance products [TurboTax](#) and [Credit Karma](#), Intuit helps put more money in consumers' and small businesses' pockets, saving them time by eliminating work, and ensuring they have confidence in every decision they make.

For over a decade, Intuit has been innovating with data and AI to help consumers and small businesses make smart financial decisions, with less work and complete confidence, enabling them to put more money in their pockets. Six years ago, we declared our strategy to be an AI-driven expert platform: an open, trusted, and easy-to-build-on platform from which we and our partners solve the most pressing customer problems and deliver awesome experiences. We're transforming from a tax and accounting platform, where consumers and small businesses have to do the work, to a global financial technology platform, where we do the hard work for them to fuel their success.

How Intuit is Using AI to Help Small and Mid-Market Businesses and Consumers

AI is a powerful tool that has long been used by large corporations to provide data-driven insights and create business efficiencies. We believe AI can help level the playing field for small businesses and consumers by optimizing efficiency and granting insights previously only available to large firms. Intuit's AI-enabled tools help automate repetitive tasks and generate personalized insights that enable consumers and small businesses to make more money with less work, and have more confidence in their decisions. Much of our AI functions as decision-support systems, helping both our customers and the experts who serve them make insightful decisions.

Intuit has been incorporating AI in its products for over a decade. Some examples of classic AI (i.e., non-GenAI use cases) we use include:

- Leveraging machine learning to build algorithms that learn from rich datasets to transform user experiences (UX)
- Applying knowledge engineering to turn compliance rules into code
- Using natural language processing to revolutionize how customers interact with products and services

In September 2023, we introduced Intuit Assist, a GenAI assistant that provides personalized, intelligent recommendations to help consumer and small business customers make smart financial decisions with less work and more confidence, enabling them to put more money in their pockets. Intuit Assist has been integrated into all of Intuit's products (QuickBooks, Mailchimp, Credit Karma and TurboTax), putting next-generation AI in the hands of consumers and small and mid-market businesses.

Small and Mid-Market Businesses

As reflected in our [2025 Intuit QuickBooks Small Business Index Annual Report](#), US small businesses make more extensive use of digital tools than other countries surveyed, but run middle-of-the-pack in terms of how frequently they make use of AI. US small businesses were also the most likely to find AI very helpful in boosting their productivity. To help further boost their productivity, we are committed to putting AI tools in the hands of all small businesses, including increasing adoption by US small businesses. Some examples of how our small business customers use AI include:

- **QuickBooks Cash Flow Management**- Leveraging small businesses' bill payments, projected invoicing, and other data, QuickBooks uses AI to predict cash flow. This helps small business owners make decisions more confidently,

such as whether they can hire additional help, buy a new piece of equipment, or pay off a loan. Now, we're taking cash flow management to the next level with agentic AI "done-for-you" experiences in production on our platform. Agentic AI workflows are now [doing the hard work on behalf of customers](#) by dynamically processing accounts receivable and accounts payable invoices with Intuit QuickBooks Online. This includes when an invoice reminder is created for customer review based on relevant documents and key insights from past history, leading to small businesses getting paid an average of 5 days faster.

- **Intuit Assist for Mailchimp** - Intuit Assist has allowed MailChimp users to use GenAI to help create marketing emails, which reduces the burden associated with creating marketing copy and lets small businesses easily drag and drop their content into emails sent to their customers. With AI, Intuit Assist helps them create an entire marketing campaign based on a brand's identity and marketing intent, targeted toward a specific audience, always with human review. Intuit Assist-created personalized automations are 50% more likely to be activated by customers.
- **Intuit QuickBooks Capital** - Many QuickBooks customers are typically underserved by traditional lenders and banks because they have been in business for less than two years and therefore lack the revenue or credit history to gain access to the capital they need. QuickBooks Capital's credit modeling processes, powered by machine learning, uses alternative data such as business cash flow, debt, receivables, and payables to assess the creditworthiness of small businesses seeking a loan. As required by law, if a customer is not approved for a small business loan through the QuickBooks Capital platform, an explanation of the factors that went into the decision is provided to the customer.
- **Intuit Enterprise Suite** - Provides real-time data insights that drive faster business decisions. This includes access to a breadth of industry-specific reports and AI-powered financial planning and analysis and project profitability capabilities that allow a business to set and manage goals, spot if a project is off track, and receive a diagnosis with recommendations on how to get a project back to profitability.
- **Other Uses** - Intuit has also developed AI tools for small businesses that help match small business owners with accounting experts; detect errors in estimates; generate a comprehensive customer call summary for call support personnel; and read, extract, and identify key pieces of information in QuickBooks Online. All of these features help small businesses eliminate mundane tasks and focus on running their business.

Consumers

AI helps our products provide consumers with personalized financial insights and recommendations as well as explain complex tax laws and regulations to help consumers fully understand their tax situations.

- **Intuit Assist for Credit Karma** - Today, Intuit Assist in Credit Karma helps provide context as our members learn more about their credit scores and financial products in a highly personalized way. This includes helping members find ways they could improve their credit score and gain insight into their spending habits.
- **Product Development** - We also apply AI to product development, to speed up the development process to get our tax software to market each year with the latest tax codes and maximum accuracy. AI helps us to convert the massive and complex 80,000 pages of the U.S. Federal tax code into an application that simplifies the process for our customers.
- **Maximize Tax Refunds** - TurboTax uses AI to help customers get the maximum refund they deserve and save time with tax prep by personalizing the experience for their unique tax situation. This can save users up to 40 percent of tax prep time and significant document retrieval effort. And, for those who do itemize, TurboTax uses data analysis and machine learning to identify and recommend deductions.
- **Intuit Assist for TurboTax** - Intuit Assist uses a combination of the company's decades of tax prep experience, tax data and documents from the filer, and current tax code to deliver a more seamless tax prep experience, with proactive insights and advice and real-time checks for accuracy and completeness so taxpayers can file with complete confidence that they are getting their best possible outcome. Additionally, the ExplainWhy feature helps tax filers understand how their refund was calculated.

Our Responsible AI Governance

At Intuit, we understand the tremendous potential AI has to help solve some of society's greatest challenges. We believe AI should be designed and used responsibly to help people.

All Intuit products are built according to our strong commitment to data privacy, security and responsible AI governance. Intuit safeguards customer data and protects privacy using industry-leading technology and practices, and adheres to [Responsible AI Principles](#) that guide how we operate and scale our AI-driven expert platform

responsibly and with our customers' best interests in mind. We put these principles into practice through a holistic [AI governance framework](#) that includes actions like executive level oversight, risk based review and testing, training and awareness across Intuit, and more.

Policy Recommendations

Ensure Small Businesses Are Represented In AI Policy Discussions. As the Trump Administration defines a new approach to fostering American innovation to promote human flourishing, economic competitiveness, and national security, small businesses need to have a seat at the table. Small businesses form the backbone of the American economy, and the AI Action Plan should reflect this by advancing policies designed to fuel their growth by putting AI in the hands of entrepreneurs.

Helping small businesses bridge the digital divide by modernizing resources and technology literacy programs will help unlock the power of AI to make American small businesses more competitive. Public policy should be updated to help small businesses grow and ultimately, level the playing field. AI policy to support small businesses should focus on three areas:

- **AI Literacy** - Small businesses stand to benefit immensely from AI technology but do not know where to turn for resources that help them understand the risks and benefits of AI. 61% of small businesses surveyed say they would not be confident to use GenAI tools for their business without training or guidance. Target programs for small businesses with collaboration from the public and private sectors to help them both understand the evolving world of AI and compete more effectively.
- **Right-sized Resourcing** - Small business government programs and funding often do not prioritize or support emerging technologies as a permissible use of loan funds, grants, and technical assistance. Modernize existing small business resource programs to ensure they provide for small businesses' emerging technology needs.
- **Ensuring Small Businesses Have a Voice** - Small businesses are often an afterthought in landmark policy debates. Yet the correlation between digital adoption and small business success is clear; studies show 84% of small businesses using more than 6 technology platforms saw an increase in profits, 82% saw an increase in sales, and 74% increased their employment compared to their low-technology-adopter peers. AI has the potential to tip the scale in favor of small businesses, they need a seat at the table. Ensure small

businesses have a voice and a seat at the table for any new regulatory frameworks on emerging technology.

Establish Public-Private Partnerships, Forums, and other Convening Spaces to Inform AI Policy.

AI is already evolving at break-neck speeds which will only accelerate under a successfully-executed AI Action Plan. To leverage the expertise and experience of those at the forefront of AI, the Trump Administration should establish and maintain information pipelines between itself and non-government experts to remain well-informed on AI developments as they occur and respond when applicable. The AI Action Plan should therefore create or utilize existing convening spaces (e.g., the US AI Safety Institute and Consortium) to allow industry - including small and mid-size businesses - to provide input and more proactively adapt AI policies to ensure America's sustained AI dominance in the years to come.

Maintain and Enhance America's Status as a Global AI Standards Leader. In 2019, President Trump launched the American AI Initiative, laying the foundation on top of which the United States has established itself as the global leader in AI innovation and responsible governance. For example, NIST's AI Risk Management Framework, which began development during the first Trump Administration, has been cited and emulated by some of the world's biggest AI economies, contributing greatly to international regulatory harmonization efforts following a uniquely American perspective.

To keep this momentum, the AI Action Plan must not only provide for investment, research, and development of new AI standards as the technology evolves, but also lay out a strategy to promote American AI standards and governance best practices internationally. Doing so is crucial to achieving greater international regulatory harmonization for companies doing business in multiple countries. Conversely, pulling back from international AI engagements would allow other governments to fill the void, such as the EU and China. Many of the areas the Trump Administration should prioritize are mentioned in this RFI, including cybersecurity, data privacy, and intellectual property. The AI Action Plan should continue the work done to ensure that America defines the rules of the road for AI standards and governance best practices in these areas, and promotes their adoption internationally.

Minimize Regulatory Compliance Burdens for American Companies by Passing Federal Privacy.

Data is critical to powering AI systems, but the lack of a federal privacy standard has resulted in a patchwork of differing state privacy laws creating confusion for consumers and compliance challenges for businesses. As of March 2025, 19 states have adopted comprehensive data privacy laws. Small businesses in

particular do not have access to a team of lawyers to stay apprised of how to comply with multiple state requirements leaving them at a disadvantage to their larger competitors. To drive AI innovation in America, we need a federal privacy law that preempts these state-level laws and sets a uniform privacy standard across the US.

The risk of a patchwork of state AI legislation is also growing. At least three states have passed AI legislation and more than 500 AI bills have been introduced in 2025 thus far. The Administration can continue to support voluntary frameworks, such as the AI Risk Management Framework, that guide and incentivize companies to develop AI governance programs to help alleviate some state concerns about company AI practices. We also encourage exploring opportunities that would help avoid a larger patchwork of state AI legislation and help support continued AI innovation for American businesses.

Ensure any AI regulation takes a risk based approach. Any AI policy framework must be risk-based to ensure that the majority of businesses utilizing AI in low risk use cases are not subjected to the same requirements as may be necessary for the most sensitive use-cases. When considering what constitutes high risk, it's important to avoid labeling entire sectors—such as all financial services or healthcare—as high risk to ensure consumers and small businesses can benefit from low or no risk AI-enabled innovations. This will ensure any new requirements build upon existing, well-established regulatory and enforcement frameworks, focus on the uses with the greatest potential for harm, and avoid duplicative legal obligations. Such an approach will help provide certainty to consumers, and large and small businesses.

Clearly Distinguish Responsibilities for Different AI Actors. The AI ecosystem is diverse, with developers, deployers, and users all playing a role in responsible AI use. These roles should be acknowledged in any new policies and responsibilities should be allocated appropriately. This includes distinguishing between companies that deploy fine-tuned AI products built on third-party LLMs, and developers of foundation models that train their AI on much larger, more generalized datasets. Delineating roles and responsibilities among different actors, including the sharing of specific types of model information and other transparency data, enhances AI explainability and provides greater assurance of AI model outputs. To implement effective safety policies, it is important for all these actors to work together and have clear roles to maintain responsible AI systems. A consistent and level playing field for all entities developing, deploying, and using AI is essential.

We appreciate the opportunity to provide Intuit's point of view on an AI Action Plan, especially the importance of AI to small businesses. We are available to provide additional information and look forward to continuing our engagement with the Administration on this topic.

Sincerely,

Michael Kennedy
Chief Corporate Affairs Officer
