

Request for Information: Development of an Artificial Intelligence (AI) Action Plan

Submitted to the National Science Foundation (NSF)

Submitted by: Irepa International, LLC

Date: March 11, 2025

Executive Summary

In response to the NSF Request for Information on the development of an AI Action Plan, we present an innovative strategy aimed at advancing artificial intelligence (AI) to be a force for good in society. This proposal emphasizes the importance of non-biased, factual data, sustainable and self-regulating AI data centers, autonomous companion robots (cobots) designed to enhance human well-being, and the need for AI to ensure that lean and small governments whose core responsibility is to protect the Constitution and the people are held accountable. By focusing on truth, sustainability, and human-centric design, we believe that our proposed model can help the U.S. maintain its competitive edge against adversaries within the United States and Outside.

1. Non-Biased Truth and Factual Data for AI/ML/DL

The cornerstone of our proposed AI action plan is ensuring that AI, Machine Learning (ML), and Deep Learning (DL) algorithms are grounded in unbiased, factual, and truthful data. AI models and systems must operate on data that reflects the most accurate and objective knowledge available, drawn from verified sources across all disciplines of human endeavor. This will avoid the pitfalls of social media-driven opinions, ego-based biases, and misinformation, which often skew decision-making. By focusing on foundational knowledge, we ensure that AI applications provide transparent and fact-based outcomes, beneficial to all sectors of society, from healthcare to governance and beyond.

2. Circular Economy AI Data Centers

To support the efficient and sustainable operation of AI systems, we propose the creation of circular economy AI data centers. These facilities will be designed as self-sustaining, self-regulating, and decentralized systems that utilize a combination of GPU, CPU, and Quantum Computing technologies. By intelligently distributing computational tasks across these processors based on real-time workload demands, we ensure optimized performance and efficiency.

Power consumption within these data centers will be managed intelligently, with energy derived from sustainable sources such as solar, hydrogen, natural gas, and other renewable energy technologies. This approach will reduce reliance on centralized energy grids and promote localized energy autonomy, further increasing the resilience of the AI infrastructure. These data centers will be deployed in a distributed manner across communities, businesses, and cities, ensuring they are locally accessible, scalable, and capable of supporting diverse applications.

3. Autonomous Companion Robots (Cobots) for Human Well-being

Our proposal includes the development of autonomous companion robots (cobots) to serve as intelligent, personalized assistants within the home and office environment. Cobots will be designed to monitor and enhance human health, well-being, and productivity by interacting with various sensors and health devices (such as smart beds, exercise equipment, and biometric sensors). These robots will act as a central hub for an individual's daily activities, providing collaborative support and helping manage personal schedules, health, and mental clarity.

Cobots will learn and adapt to the unique needs of each individual, fostering a deeper connection between humans and their technology. By offloading the burden of knowledge management and device control to the cobot, humans can focus on more meaningful human-to-human interactions, optimizing their emotional, mental, and spiritual well-being. This support will guide individuals toward personal growth by helping them transcend lower chakra-based ego needs and focus on higher consciousness.

4. Community Sustainability Through Cobots

Cobots will play a pivotal role in fostering community-level sustainability. They will assist in developing organic gardens for growing fruits, vegetables, herbs, and spices, enabling communities to become more self-sufficient in their food production. In addition, cobots will support clean water initiatives by purifying and distributing spring water, ensuring communities have access to clean resources.

In the economic realm, personal cobots will also facilitate decentralized transactions using a cryptocurrency network. This system will allow households to engage in buying, selling, and trading goods and services autonomously, free from the influence of centralized financial institutions. By enabling secure, peer-to-peer transactions, cobots will foster greater economic independence and resilience at the community level.

5. Cobot as a Tool for Psychological and Social Health

The personal cobot will serve as a lifelong companion, from infancy to old age. It will not only assist with day-to-day tasks but will also be crucial in identifying and addressing negative psychological programming that could lead to issues such as narcissism, psychopathy, or sociopathic behavior. By actively monitoring emotional and social development, cobots will help guide individuals toward healthier emotional states and social interactions.

This role is particularly vital in the context of the educational journey. Cobots will support individuals in their transition from childhood through school and into the workforce, ensuring they are equipped with the emotional intelligence necessary for successful collaboration in business and government. By focusing on human connection and well-being, the cobot will help nurture a society where individuals contribute positively to the collective good.

6. AI to Police Lean and Small Governments

A critical element of this action plan involves the application of AI to ensure that lean and small governments, which are responsible for protecting the Constitution and the people, remain transparent, accountable, and effective in their duties. AI will serve as a tool to monitor and assess government actions, ensuring that they remain aligned with constitutional principles and the protection of individual rights.

AI systems will analyze and cross-check government policies, decisions, and actions, flagging any discrepancies or deviations from lawful, ethical, or constitutional guidelines. By automating the oversight of government functions, we reduce the potential for corruption, abuse of power, and human error. This will provide an additional layer of accountability, making sure that public servants remain true to their obligations and serve the people efficiently, fairly, and transparently.

Conclusion

Our proposal outlines an ambitious and forward-thinking strategy to ensure that AI and associated technologies serve humanity in a meaningful and ethical way. By focusing on non-biased data, sustainable AI data centers, autonomous companion robots, and using AI to ensure that lean and small governments protect the Constitution and the people, we aim to create a system where humans are supported in their journey toward personal growth, social harmony, and environmental sustainability. This proposal offers a holistic approach that not only advances technological innovation but also nurtures a healthier, more collaborative future for all.

We believe that our approach can position the United States as a global leader in AI and technology, promoting well-being, sustainability, and competitive advantage on the world stage.
