Hello,

As a student doing a Masters in Artificial Intelligence at MTU in Ireland (I am a citizen, don't worry), I cannot stress enough how absolutely terrible of an idea it would be for AI to *not* be heavily regulated and restricted in what data it can be trained on and what applications it can be used for.

It has zero place whatsoever in any kind of creative field, and is nowhere near as effective or capable as its proponents would have you believe, especially not when the energy consumption is taken into account.

AI companies should, if anything, be held to even more strict scrutiny on matters of copyright than other companies because it is so incredibly difficult to be sure what was used without some degree of co-operation from them and realistically they will refuse to give that co-operation unless they are forced to.

It is a tech-based bubble, similar to the previous dotcom bubble, and *will* inevitably go under at some point in the near future, which would make this carve-out embarrassing at best and economically disastrous at worst.

While there are valid uses for the underlying technology, those do not require this kind of carve-out in any way and will continue to be worked on even if the main well-known AI companies go under entirely because the *useful* uses for AI have very little overlap with the anti-creative garbage that is most of what the big companies are doing and promoting.

This law is functionally indistinguishable from a housing company in a district where theft of building materials is not yet illegal trying to get themselves a carveout because they've cut so many corners and funnelled so much money to their executives that being able to outright steal the materials they work with is the only way they can avoid going bankrupt, and that they can't *possibly* be expected to *pay* for them! Leaving out, of course, that they very probably *could* afford to do so by cutting back heavily on executive spending and bonuses or on stock buybacks or the like.

This will provide no benefit whatsoever to the USA, and will in fact actively hamper our

creative growth as creators - especially smaller creators - would be discouraged from creating if AI companies can simply take their work with no compensation and the resulting AIs can be used to generate derivative works that benefit from their creativity with, again, no compensation. Further, this will stifle actual economic growth by concentrating even more wealth and economic power in the bank accounts of corporations that already collectively have far too much rather than in the hands of people who would actually use it meaningfully.

In summary, there is no good reason why this should pass into being as any kind of law, grant, exemption, or legal entity of any kind, save to line the pockets of AI companies by letting them not pay for copyrighted materials.

Thank you,

Jack Haseldine
