Subject: [External] AI Action Plan
Date: Sunday, March 16, 2025 2:53:33 PM

CAUTION: This email originated from outside your organization. Exercise caution when opening attachments or clicking links, especially from unknown senders.

I oppose this plan.

"cybersecurity, data privacy and security throughout the lifecycle of AI system development and deployment (to include security against AI model attacks), risks, regulation and governance, technical and safety standards, national security and defense, research and development, education and workforce, innovation and competition, intellectual property, procurement, international collaboration, and export controls."

AI can be a tremendous tool when properly vetted and overseen for errors. Released unsupervised, I see many problems ahead.

Cybersecurity... opportunities for mis-reading other cultures whose language reflects different thinking than traditional US language could cause problems which cannot be easily resolved. Who is reviewing the AI being used here?

Data privacy and security: I expect security breaches with AI which doesn't recognize all types of names, especially since the DEI removal stupidity, many names are not traditional US names and many people have changed their names to fit their identity. If AI is used to remove or identify these names, people will be harmed. If certain names are released in an unauthorized way, people will be harmed.

Risks: we can't even identify all the risks involved with AI. Studies have shown they contain errors an astounding percentage of the time. What guardrails are being put into place to identify and correct these errors?

Regulation and governance: again, with the error rate being high, how are possible regulation infractions going to be identified and corrected? With governance, I can imagine a mis-directed governance issue being incorrectly interpreted and causing harm to people.

Technical and safety standards: with the removal by the President of crucial safety standards, I don't see any useful role for AI except counting bodies of people who have died due to unsafe conditions. Clean air and water are apparently not important to our current billionaires running the country. Technical standards, if not enforced correctly, can and will cause programs to crash or run incorrectly. Who is keeping an eye on these important standards?

National security and defense are the last places to use AI, with the huge error rate of AI interpretation.

Research and development can benefit from AI tremendously. These scientists (if they haven't been fired by the shirt-sightrd and money-hingry administration) have been using AI for years and their methods of testing, reviewing, testing, reviewing, and sharing their results with peers, asking for their reactions, are models of what AI is able to accomplish.

Education and workforce: this really concerns me after the President ordered the removal of any reference to supposed DEI people or programs, which have built a foundation that cannot be erased. AI could be used to reinstate those removals in another four years.

Innovation and competition will be fertile grounds for AI, since, again, the use of AI will be carefully reviewed and supervised.

Intellectual property must be preserved and protected for the human beings who create it. AI being used to imitate, for corporate greed, the creativity of human brains, is unacceptable. If, however, a new category for AI creations is developed, those activities can be viewed, read, listened to on their own merits and judged accordingly.

AI can be used for procurement, and the errors will be caught through the ordering and receiving process. Anything ordered in error will be discovered. The returns process might be a nightmare but I expect human beings will eventually resolve most common errors.

International collaboration using AI will be a joke. Mutual collaboration between different cultures is developed through relationships between human beings. Trust, which is fragile and easily broken, is grown over time with small activities and honest discussions. I cannot imagine that AI could be helpful here.

Export controls using AI will develop over time, after common errors are resolved.

Thanks for letting me share my opinions.

Jessica MacPhail, she/hers
