

Joshua Chao

Set up social safety nets to protect all citizens by equally distributing the value provided by AI to everyone. What is the point of accelerating AI development if the vast majority of citizens will not be able to reap the benefits? In simpler terms, AI will lead to a massive loss of jobs, and ideally free up a lot of time to pursue interests that are not rooted in economic interest. This is not necessarily a bad thing, as long as there are social programs in place to provide for those whose who have been displaced. As it currently stands, the only people that stand to benefit are CEOs/billionaires simply because America's strategy to ensure continued contributions to society at scale is to direct provision of basic necessities to corporations (retirement funds, healthcare, ability to pay rent/mortgages, etc). AI replaces workers. CEOs still profit from the work being done, without having to pay for said work. What happens to the workers? We have an unbelievable opportunity to permanently bridge the wealth gap by decoupling human labor from technical knowledge, or permanently widen the chasm with no hope of building a bridge. America has always been founded upon the principle that anybody should be able to make a name for themselves, but if you take away the opportunities for people to rely on their skillsets and knowledge, then a vast majority of citizens will be ruined because everything in America costs money, and that money has historically come from working a job. You can soften this blow by categorizing the domain knowledge/roles/jobs that will never be replaced by AI, and rewarding those who excel at them to redistribute workforce specialization. I hope the federal government stands by its commitment to the populace to better us all by setting up an appropriate stage when AI is ready to be a drop-in replacement for the majority of jobs.
