If current trends in AI continue, the US will lose the trust and confidence that the world places in our technology and "American Know-How". In particular, we must protect copyright; ensure quality; and demonstrate efficiency.

Copyright is of paramount importance. American creativity cannot be sacrificed to corporate interests, especially when those corporations could sell that creativity to foreign individuals. AI models must be able to cite their sources for all outputs, including images, styles, colors, code, and phrases. Only this kind of citation can protect the rights and works of American authors.

Quality is next in importance. If AI results can't withstand factual verification, American AI will garner the same reputation as early Japanese products: "cheap crap". We must eliminate hallucination, whether by rejecting invalid results before presenting them to the user or by improving inputs and training. Holding the AI model developers legally responsible for invalid results is probably the most straightforward solution.

Finally, we must demonstrate that AI results can be obtained with similar resource expenditure to human results of the same quality. Why would I waste my money, effort, time, or energy? I can easily commission art, writing, or research. The speed advantage of AI is no use if its outputs are invalid. There are also limits to how much speed is useful. When AI consumes the same energy and water as a human does in a day, it must also produce results equivalent to a Human's day of effort.
