

Julia Edinger

I believe any AI advancement should include guardrails to protect people with disabilities and other marginalized populations who may be harmed by datasets that do not accurately represent the non-monolithic makeup of our population. People with disabilities can benefit from AI, like dictation tools, but can also be harmed by automated decision making systems. The US Access Board and Center for Democracy and Technology have been working on this and should continue to be involved in any federal AI policy or strategy development. The US will never establish AI dominance if it leaves part of its population behind.
