Katy St. Clair, [REDACTED]

My name is Katy St. Clair and I am a second semester senior at Avonworth High School. I studied generative AI and its impact on politics for two months in a course on AI and Ethics this year. From my research, I believe there should be more regulation when it comes to generative AI. Using AI to promote a party ultimately undermines public trust in the government. Civilians want to hear what real people can do to help them if elected. At-home generative AI systems such as Amazon Alexa or Google Home need to be regulated, and multiple reports of bias have come out regarding the devices' answers to some political questions. This should not happen, the machines either need to decline to answer political inquiries or have a regulated list of proven facts they are allowed to discuss. During the 2024 election, President Donald J. Trump reposted AI-generated photos to his millions of followers on Twitter or X. The pictures showed a popular celebrity at a Trump rally wearing MAGA gear offering support to the candidate, however, it is incredibly misleading to viewers, especially those who may look up to the celebrity. It also is extremely unprofessional for a politician to blatantly post misinformation in any situation no matter the type of media. Tighter regulations are also needed on image generation AI, ideally there should be certain words and phrases that AI cannot recreate due to current political issues. This is because supporters of candidates use this AI to create fake, misleading, and vulgar images of other candidates. I feel that using AI in political campaigns is a lie to the people of America.
