Lauren Golanty

Any National AI Action Plan must engage in reducing energy consumption and increasing efficiency as its highest priority policy action. Data centers should mitigate the carbon emissions associated with AI's energy consumption by transitioning to renewable energy sources, like solar and wind, and adopting energy-efficient practices. AI must have NET ZERO emissions, and if we are smart, NET POSITIVE carbon effects, to ensure a livable future for our children, who will lead the AI-ensconced world of tomorrow.
