**RE: Request for Information on the Development of an Artificial
Intelligence (AI) Action Plan**

INTRODUCTION

Greetings,

My name is Lewis D. Migliore. I am currently pursuing a law degree and have previously worked as a funeral home attendant, as well as a law clerk for a criminal defense firm. I engage with technology on a daily basis and have observed significant advancements in artificial intelligence over the past two years.

I commend the executive office and the National Science Foundation for their efforts to regulate this rapidly evolving technology. Additionally, I express my gratitude to the National Science Foundation for providing me with the opportunity to contribute input on concrete policy initiatives that should be included in the “AI Action Plan.”

Outlined below are the specific policy initiatives that I believe will most effectively enhance human flourishing, economic competitiveness, and national security in relation

to AI. These measures aim to ensure a brighter future for all Americans as we transition into the age of artificial intelligence.

I. American Workers First

One of President Trump's primary campaign promises was to prioritize the American economy and the American workforce. Artificial Intelligence (“AI”) possesses the potential to generate substantial wealth and provide more efficient and effective solutions for both public and private sectors. This technology is truly groundbreaking and is poised to have a transformative impact on nearly every industry in the American workforce. To ensure that this transformation benefits all Americans, it is imperative that these positive economic effects are extended to everyone, rather than being concentrated among the select few who own the AI. By doing so, we can fulfill the promise of prioritizing the American worker and achieving the most desirable outcome for the nation's entire economy.

A significant risk threatening the average American worker is the potential for widespread job losses due to AI automation. Recently, Anthropic CEO Dario Amodei forecasted that in the next 3-6 months, AI will be writing 90% of company’s code, and within the next year, AI will generate nearly all of the company’s code. Additionally, Presidential advisor and businessman Elon Musk predicted at the 2024 Vivatech Conference that as AI advances it will result in mass automation becoming prevalent, and that as a result “probably none of us will have a job.”

Therefore, one concrete policy initiative that should be emphasized in the “AI Action Plan” is that the human worker should be prioritized and placed before artificial intelligence machines. This is of particular importance in industries like governance,

medicine, and law where empathy in decision making is crucial. Again, it is of the utmost importance that we ensure that artificial intelligence machines never entirely replace human workers and their roles. Instead, AI should be used by human beings as a tool to make their work more productive, efficient, and effective.

At first glance it may seem appealing for government leaders, employers and business executives to replace workers with machines in an effort to save money and increase productivity, especially as AI continues to advance. However, this approach should be avoided and discouraged.

Work is a significant part of our culture. It provides purpose and fulfillment. It is ancient. From the beginning of human civilization individuals have taken pride in mixing their labor with the natural world around them to produce goods and services that provide for themselves and their families. Work allows individuals to directly shape and impact their communities. It gives individuals an opportunity to achieve, to find fulfillment, to develop themselves, and to leave a legacy. In fact, working is one of the most meaningful ways people express themselves and interact with the world around them.

In my hometown of Pittsburgh, Pennsylvania the work individuals do makes up a significant part of their identity. From steel workers, to lawyers, to doctors, to factory workers they all find purpose in the work they do and are rewarded with tremendous pride in knowing that they matter, they contribute to the community, and that they can provide by their own hand and through their own efforts.

If mass layoffs in the public and private sectors were to come at the hands of AI automation it would remove this purpose which is a core part of many Americans' identity. This would likely result in a mass cultural and mental health crisis. This is because mass automation would remove the ability for people to depend on themselves and their own skills in earning their own way and would instead make them dependent on government handouts like universal basic income or the severance packages that their companies offer them. The purpose, fulfillment, independence, personal development, and community all created from work would be lost. This would likely have a devastating psychological impact on the average American worker and have a negative net impact on our culture and society.

To avoid this the American worker should be put first. Instead of replacing the worker with a machine, the machine should be used as a tool by the worker to improve individual performance, increase human efficiency, and excel human achievement to new heights. As iconic American musician Prince famously said, "it's cool to use the computer, but don't let the computer use you."

Therefore, included in the "AI Action Plan" should be policy that discourages mass replacement of workers with machines. Instead, the action plan should promulgate policy that encourages companies and government to utilize artificial intelligence as a tool to excel human achievement to new heights. The AI Action Plan should also encourage individuals and companies to never place complete faith in AI systems. Rather, all results obtained by AI should be assessed by a human being to ensure that they are ethical, accurate, and reliable. AI systems should be encouraged to be used to enhance human reasoning rather than to completely supplant it.

Further, an essential aspect of integrating AI into society is ensuring that our workforce is equipped with the necessary skills and knowledge to work alongside these advanced technologies. So rather than replacing workers companies, governments, and educational institutions should adapt their curricula to include comprehensive AI and technology courses and training. This will foster a new generation of tech-savvy individuals who can thrive in a rapidly evolving job market and use these tools to perform at a higher level. Training programs should be made accessible to current workers, providing them with opportunities to upskill and reskill, allowing them to effectively utilize AI as a tool rather than seeing it as a threat to their livelihoods. Again, AI training should emphasize that technology is a tool to supplement and aid in critical thinking, not something met to replace it.

In summary, the transformative potential of AI should be harnessed responsibly to benefit all Americans and enhance human work rather than replace it. Prioritizing the American worker, equipping our workforce with the necessary skills, and promoting policies that encourage the use of AI as a tool and not a replacement, can help preserve the purpose fulfillment, human expression, and development derived from work.

II. Bipartisan Cooperation

Due to the transformative and ever evolving nature of this groundbreaking technology, cooperation across party lines is paramount. In these political divisive times collaboration may sometimes seem like an impossibility, however Americans must find a way to unify when it comes to addressing technology as revolutionary as artificial intelligence.

Thus, the AI Action Plan should highlight the innovative nature of this technology and underscore the necessity for collaboration across our government and society. We must all come together to formulate and implement sensible regulations, strategies, and guidelines. We must set aside our differences and unite to address this profound change. As Benjamin Franklin famously said, “We must all hang together, or we will surely hang separately.” If we do not collaborate for the common good regarding this technology, it may lead to our demise.

Consequently, bipartisan cooperation is essential to effectively regulate AI and ensure that the benefits are shared across all segments of society. The development and implementation of groundbreaking AI technologies transcend political ideologies and demand a unified approach. Law makers, policy makers, and citizenry from both sides of the aisle must collaborate to create comprehensive policies that safeguard public interests, promote innovation, and address potential risks. We need to ensure that this technology works for the benefit of everyone and not just a select few.

Therefore, the AI action plan should encourage the continued operation and expansion of the “AI Task Force”. This task force should be encouraged to consider different perspectives regarding the topic from people of all walks of life.

By continuing to have bipartisan effort in regulating AI we can bridge gaps, foster trust among stakeholders and citizenry, present a balanced perspective that incorporates diverse viewpoints, and bolster innovation. This continued cooperation will not only strengthen regulatory frameworks but also enhance the credibility and legitimacy of AI governance. By working together, we can create robust policies that protect privacy, prevent misuse, and promote ethical AI usage while fostering an

environment conducive to technological advancement, unification, and economic strength.

By collaborating on this significant issue, the bitter political divisions in the country may be reduced, benefits could be more widely experienced, and trust in government by the general public might be restored. AI is likely to transform our society. This transformation should be one that unites us and benefits us all.

The existing AI task force plays a crucial role in strengthening this bipartisan effort. Thus, it is imperative that the AI task force continue to operate. Said AI task force should be expanded to not just more members of our government, but to also bring together technologists, ethicists, sociologists, lawyers, policymakers and other experts to address the complexities of AI integration in society. Their collective expertise would ensure that the policies developed are well-rounded and represent all walks of life in our society. Considering the multifaceted impact of AI on different sectors, this spirit of unity and collaboration is of the utmost importance.

The existing task force should be encouraged to conduct thorough assessments of AI technologies, identifying potential risks, and recommending safeguards to prevent misuse. They should also be encouraged to be responsible for evaluating the ethical implications of AI applications and ensuring that technology aligns with our societal values, laws, and our Constitution. By providing a platform for continuous dialogue and collaboration, the task force can help bridge the gap between rapid technological advancements and the slower pace of legislative processes. The task force can provide valuable updates to Americans who are seeking to be informed on the changes, and work together to address and legislate novel legal issues like the implications of AI on

intellectual property. Additionally, the task force can help foster unity among the American people in some of the most divisive times we have seen.

Moreover, the continued operation and expansion of a bipartisan AI task force could enhance transparency and accountability in AI governance. Regular reports and updates from the task force can keep the public informed about the state of AI development and its implications. This transparency would foster trust among citizens, assuaging fears of unchecked AI deployment and reinforcing the government's commitment to protecting public interests and promoting human flourishing.

In summary, promotion and expansion of bipartisan cooperation in AI regulation, supported by our existing AI task force, would not only strengthen the regulatory framework but also ensure that AI technologies are developed and implemented in a manner that benefits all Americans. This collective approach would help harness AI's potential for the greater good, benefiting all Americans and maintaining the nation's competitive edge on the global stage in an ethical and legal manner.

III. Privacy, Transparency and Oversight

Artificial Intelligence systems can collect and monitor large amounts of data, including sensitive personal information. The AI Action Plan should ensure data is collected solely for the specific purpose of the AI system using it. This purpose, absent a compelling reason to keep it classified, should be published and readily accessible to the general public. Citizenry should understand both how AI systems work, and how they make decisions. Data usage by the AI system should fulfill its enumerated purpose only and not be used for anything outside of that scope. Absent a compelling reason, like national security, citizenry should be able to see the data that AI systems are trained

on, and the data they collect in making their decisions. This will promote transparency and protect privacy interests. To further protect privacy the task force mentioned above, or another agency, should conduct regular audits of all AI systems used in government to assess that they are acting with respect to the privacy of the citizenry, and to ensure that the systems are not being used outside of the scope of their clearly defined purpose. Any data collected should only be collected if the user explicitly consents to said collection.

Additionally, it is of the utmost importance that proper cybersecurity systems are put in place to protect the personal data of Americans from international enemies, hackers, and other bad actors who seek to improperly use it.

One idea in promulgating this policy is to open-source the datasets used by AI systems wherever possible. This would provide full transparency and allow for continuous improvement of the AI systems through public scrutiny and collaboration. In cases where open-sourcing is not feasible due to national security or privacy concerns, there should be stringent guidelines and oversight, perhaps by the “AI Task Force”, to ensure the data is used ethically, legally and responsibly. Our government should prioritize open-sourcing to the greatest extent possible, and companies should be encouraged to follow suit. Through open sourcing we can create a culture of transparency, build trust and drive technological advancement that benefits all Americans. With that being said, some data should be kept confidential if it is found to pose a significant national security risk. This confidential data can be reviewed by certain members of Congress, perhaps the AI Task force, or an agency to ensure that it is not being misused.

Another essential policy initiative is the establishment of benchmarking systems for companies and government agencies. These benchmarks would serve as standards for evaluating the performance, accuracy, and ethical and legal compliance of AI systems. Regular assessments against these benchmarks would ensure that AI technologies meet the highest standards and operate within the defined ethical and legal frameworks. Benchmarking can also promote healthy competition among developers, pushing them to innovate while adhering to ethical and legal guidelines. Perhaps a body like the existing “AI Task Force” mentioned above could be responsible for creating these benchmarks and ensuring that they are being complied with.

Incorporating these ideas into the AI Action Plan would significantly enhance transparency, accountability, and trust in government. Open-sourcing datasets and establishing benchmarks would create an environment where AI systems are continually evaluated and improved, while also ensuring they operate in a fair manner that benefits everyone. These measures would not only bolster public trust but also contribute to the responsible development and deployment of AI technologies, maximizing their benefits while mitigating potential risks.

Moreover, National security agencies should be instructed not to create a mass surveillance state or engage in extensive personal data collection against the citizenry. It is crucial that we balance the need for security with the protection of individual liberties, and individual privacy as outlined in the Fourth Amendment, which guarantees a reasonable expectation of privacy. AI surveillance technologies, if left unchecked or made too extensive, could lead to an erosion of trust between the government and its citizens, fostering a climate of fear and suspicion and a creation of a mass surveillance

state. Transparency, oversight, and strict limitations on data collection and storage should be established to ensure that AI is used responsibly and ethically within the national security framework. There should be a clearly enumerated purpose for each AI system used by our government. No data should be collected that falls outside of the scope of said purpose. For national security agencies it may not be feasible to publish this to the general public due to the need to keep some information confidential. Therefore, it is of the utmost importance that a detached impartial body, like the AI task force, have access to this information and can oversee the data use to ensure that it complies with our individual rights. Thus, the AI action plan should emphasize that Human oversight is key in ensuring that AI aligns with the constitutional protections of privacy.

Private initiatives like Sam Altman's Worldcoin, which gather extensive personal data, should be discouraged as they threaten individual privacy.

Worldcoin is a cryptocurrency project founded by Sam Altman, aiming to provide universal access to the global economy. Its mission includes distributing tokens to everyone in exchange for iris scans of the human eye. Biometric data collection like this is invasive, and a risk to individual privacy and security, as it involves storing sensitive personal information. Invasive practices like these should be discouraged from the private sector and entirely prohibited throughout our government.

Furthermore, the use of AI in the criminal justice system should be kept to an absolute minimum, particularly in areas involving human value judgments, such as sentencing. Decisions that deeply affect an individual's life and liberty should not be left to algorithms alone, as they lack the capacity for empathy, understanding, and moral

reasoning that humans possess. Implementing AI in these sensitive areas could lead to biases and injustices, further undermining public trust in our criminal justice system. Even if it comes at the expense of less efficiency and more costly procedures, these judgments should be almost entirely left to human beings.

Prioritizing human oversight and judgment in these critical areas ensures that technology serves as a tool for justice rather than a replacement for human wisdom. By maintaining this balance, we can harness the benefits of AI while upholding our core Constitutional values and principles. In conclusion, humans must remain in control of AI technologies, ensuring that they are developed and implemented responsibly, transparently, and ethically, aligning with societal values, laws, and our constitution. Data collection and usage should be kept to a minimum and invasive collection of personal information should be limited as much as possible.

IV. Environmental Protections and Cultural Preservation

AI data centers consume a significant amount of energy, drawn from vast amounts of electricity and water. If the physical development of AI systems is left unchecked, it may overpower our power grid, lead to drought, or result in other devastating environmental effects. Moreover, electronic waste from data centers, and mineral use and extraction to power these data centers, can also harm our environment. All of this should be accounted for in the AI Action Plan. Development and protection of our real world should always take precedent over the digital one. For every investment made toward the digital infrastructure, there should be a similar investment made for the protection of our environment.

Innovation and advancement are good, but not if they come at the expense of the destruction of our natural world. Thus, it is essential that the AI Action Plan encourage data centers to be built and operated only in areas where there are sufficient resources to support them. Additionally, there should be limitations on the number of data centers constructed, energy used, and electronic waste produced.

If we do not enact these measures, our natural world may become overrun, our power grid may fail, and pollution and drought may increase tremendously. This would have a devastating effect on the economy. As we create and invest in this digital world, we should also make investments in the real world. Our national parks, hiking trails, rivers, fisheries, farms and oceans should be approached with just as much emphasis as AI. It is crucial that we balance our desire to innovate and advance with respect and effort to protect our beautiful natural country.

V. Technology Addiction

The impact of technology and AI on our daily lives cannot be overstated. Many Americans today feel like they spend too much time online. Technology plays an excessively large role in our lives, contributing to anxiety disorders, fear, depression, addiction, and the dissemination of fake information. Thus, I believe the AI action plan should emphasize balance between the real world and the digital one.

AI should make us all more efficient, ideally freeing up more of our time. With this free time, the government should promote "unplugging" from screens and engaging with the natural world. This can be done through encouraging citizens to reduce their reliance on technology in their daily lives, promoting a balanced and healthy lifestyle. Campaigns can highlight the importance of taking breaks from screens, while health

agencies can publish reports and conduct studies on the harmful effects of excessive internet usage, and recommend non-digital alternatives to promote better mental health.

Additionally, government programs can actively promote the benefits of physical exercises, outdoor activities, and face-to-face interactions, encouraging citizens to take advantage of the natural beauty and resources available to them. Promoting our amazing National Parks and the tremendous opportunities for recreation that this great country has to offer, such as hiking, fishing, and simply spending time outdoors, can contribute to better mental health, physical health, and overall well-being.

Furthermore, educational institutions can play a pivotal role in addressing technology addiction. Schools and universities could integrate curricula that teach students about the responsible use of technology and the importance of maintaining a healthy digital balance. Workshops and seminars on digital detox strategies and mindfulness practices can help students understand how to manage their screen time effectively. Further instruction can be provided to help individuals distinguish real content from fake AI generated content.

Community centers and local organizations can also create programs and initiatives that encourage social engagement and physical activities. Hosting events like "tech-free" weekends, outdoor festivals, and group exercise classes can foster a sense of community and promote healthier lifestyles.

Employers can contribute by promoting a healthy work-life balance for their employees. Encouraging regular breaks, limiting after-hours emails, and promoting

wellness programs can help reduce digital fatigue and enhance overall productivity and job satisfaction.

By emphasizing these points, we can disconnect from excessive use of technology and instead connect more with the real world, ensuring that technology serves us rather than controls us.
